TAPR PropNET APRS Mailing List Archive, January 2001 through January 2002

January 2001 through January 2002

TAPR's forum for using APRS stations and beacon networks to study radio propagation, including automated observations, path measurements, station configuration, mapping, data collection, software, antennas, band openings, and experimental network design.

This volume contains 13 original monthly files and 5,260 messages, arranged chronologically. The PDF is a readable access copy: MIME transfer encodings are decoded, HTML bodies are converted to plain text, and non-text attachments are represented by descriptive notes. The raw source text is supplied separately with the Internet Archive item.

Hello to the reflector and anyone who might be able to help me with a setup of UIView. I have an omni directional antenna, 50w 2m rig, a Kantronics KPC-2 with the 5.0 firmware, and have been able to get it set up in KISS mode. All seems to be well, but I'm a bit confused on how to set my unit to transmit. As stated on the BeaconNet web site, there are designated times to transmit, and designated times to receive. Should I be setting up my station for meteor scatter, or how can I set the unit to say 3 packets 5sec apart every 45 sec at say 15 sec past the top of the minute? I'm a bit confused for someone just starting to experiment with this really neat concept. I would like to hear from some successful individuals who have worked with UIView -73's and Happy New Year
John Paul Dooley W6ZIP

Hi John,
If you are asking about Meteor/Saturation Mode, then DM14 places you in the "third quadrant" of the continent. That means that you are assigned to transmit from 30 to 45 seconds after each minute, listening for the other time. By the way...50 watts to an omni isn't much in meteor scatter work. If you can muster a 160 watt amp, you'd be much better served. Although you ought to be a pretty good receiving station, transmit success usually needs a minimum of 400 watts of ERP (50-watts to a 9-dBd gain antenna), though every once in a while a QRP station makes it. Just don't get discouraged. :o)

If you are interested in "standard mode" operation (sitting by and watching for band openings), then you setup to transmit once every 10-minutes, 24/7.

You have an advantage either way. Since you are using a Kantronics TNC, you have the ability to use software carrier detect. To invoke that, exit from UI-View and open a hyperterminal session to your TNC. Invoke the command CD SOFTWARE. Then close the terminal session. Doing this will allow you to operate with squelch "open". You'll be able to decode weaker signals this way. fyi.

Welcome aboard!
Ev, W2EV

Rendered body type: text/plain

Ok, I'm a little excited. (huge understatement)

I recently learned that IARU Region 1 has an F3D (AFSK Data...like what we use on BEACONet) allocation on 10-meters from 29.2 to 29.3 MHz.

Yesterday, I put a simple 1/2 wave vertical up and tuned my
HF radio to their APRS/BBS frequency and left it running in
RX-only mode (I pulled the mic plug from the transceiver).

This morning, I was greeted by the following receptions:
G0THP   5,438 km
SV2DFT-12   (probably GATED through 'BBO)
SV2BBO   7,825 km <- an APRS 10-meter gateway
SV2TSL-11   (probably GATED through 'BBO)
SV2TWC-12   (probably GATED through 'BBO)
SV2FPV   (probably GATED through 'BBO)

I wanted to share this with my fellow BEACONet brothers
before I shared with the rest of the world.

Moral: These receptions were made using the much less
efficient (for our purposes) APRS lat/lon frames. Imagine
the success that we can/will have once we get more
participants using the BEACONet [GR##ID] system on a
frequency with an infrastructure that supports propagation
study!

Keep the faith, folks! It's just a matter of time before we
see similar 6-meter and 2-meter results. Additionally, I'm
trying to figure out why we in the USA have no AFSK Packet
allocation on 10-meters! (that's why I was setup for RX
only, by the way) My hope is that this is a simple
oversight in the FCC rules and regs (or my feeble eyesight
missing it).

Ev, W2EV
ps...the frequency was 29.250-MHz. You didn't think I'd
leave you hanging, did you? :o)

pps...this is an APRS service frequency. I'm thinking of
evanglizing 29.29 as an international BEACONet frequency
(outside of the USA, anyway), if I can drum up any interest
overseas.

Rendered body type: text/plain

Hi All and Happy 01

I think that there is 3 of us that will be trying 223.780. I would like to
know what the schedule of the other stations will be so I can budget my Solar
power and only use 223 TX when I know that there is someone on the band.

I will set up 223 to RX as soon as I know that someone is TXing and let it RX
all week if needed. I plan to TX as much as possible / practical.

Thanks
Rich

Rendered body type: text/plain

My 2-meter station is on the outs. No participation on that band this
time :o(

So...its 223.78 all the way for me. I'll activate from Midnight to Noon
Local, Eastern time. The amp gets plenty warm by then. I'll power up
starting tonight (the morning of the 2nd) and run for the next three
cycles (morning of the 2nd, 3rd and 4th)..

With a 4-element beam, my 3db points will cover the entire eastern
seacoast through the Gulf states and west to at least Arkansas (I'm on
the south shore of Lake Ontario, in New York -- America's North Coast
<g>).

By the way...this looks like a promising event for those on the West
Coast. I would hightly suggest that you folks re-examine the directions
that you are pointing your antennas and use a timing sequence that makes
more sense for your local conditions. More on this in my next eMail.

7. [propnet] Western Participants Note...

From: "Ev Tupis (W2EV)" <propnet@greeceny.com>
Date: Mon, 01 Jan 2001 13:28:37 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-127650-2001.01.01-12.45.17--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Taking a look at the map on the METEORegistry page, I notice that there
is an interesting cluster of activity in the Western States. You may
wish to consider changing your "Saturation Quadrant" to facilitate
upping the odds for success.

With the exception of Earl in New Mexico, with his possible shot to the
folks in the South East, western folks may wish to consider a different
schedule.

Consider the "North-south" divider being the Nevada/Utah border, and the
"East-west" divider being the point where Nevada,California and Arizona
meet.

Additionally, by running a quadrant system "counter clockwise" (opposite
the "normal"), you maximize success for your region, while still
allowing Earl to maybe copy something from the southeast!

Based on this new quadrant dividing line and the folks that have
registered on http://go.to/METEORegistry:

 0-15 seconds (northeast of the origin) No One
15-30 seconds (northwest of the origin) KE6AJE, W7LRD
30-45 seconds (southwest of the origin) KF6FLJ, and the others in SoCal
                                        (too tight to see all)
45-60 seconds (southeast of the origin) K7RJR, KD5XB

This is just a suggestion, but a good example of using a quadrant
method, and modifying it with no ill effects, but plenty of pluses.

Rendered body type: text/plain

I have added a few enhancements to the METEORegistry web page. It now
indicates the antenna size. More antenna elements are indicated by a longer
line. Future MS events will allow you to indicate the "direction" of your
antenna. It currently defaults to NW.

Hi All

I had a weird TVI problem last night and was TXing with only 25 watts. When I
turned the beam NE and the amp was on I would tear up my computer monitor. It
was to late to try and solve the problem so I let it go till this morning.

I unhooked the TNC and keyed the rig and wham TVI. That ruled out feed back
through it. The high SWR protection was not tripping the amp off so I ruled
that out. I turned the beam while the rig was TXing and the TVI stooped when
the beam got to east. Could it be? Yep! I used a field strength meter and
sure enough Right at the monitor was the strongest reading while the rig was
TXing. Not able to move the monitor or antenna I decided to get some AU foil
and play. I draped the foil over the monitor and low and behold no TVI. I did
not want foil on my monitor so I tacked it to the wall behind the monitor.
Problem solved! The wall the foil is on lies between the antenna and monitor.
The antenna is about 30 feet above the house and my house has a metal roof.
The tower is about 30 feet from the side of the house. What can I say? Good
old Aluminum Foil!

Just a point about the Kantronics Software detect. I use a KAM+ and a KPC3
in KISS modes, with open squelch, and UI-View without problems.

I did select Software for the CD setting in both TNCs and then selected KISS
setup from the UI-View Communcation selection, and it seems to work fine.

Cheers de Dave (G0DJA)

Options, Announce Stations, uncheck both options.

Or leave "First Time Only" checked, and check "Synth callsigns" in
Miscellaneous Setup, then I'll speak the callsigns instead of the bell
ringing.

Hi guys,
I set my small station up last night and then headed for a night shift at work. Stepping out at about 4:00 a.m. PST I was able to see many short burns in jus a few minutes of observation. When I arrived home though, no contacts! Well, we will just have to try again during more activity. Hope everyone will be on again tonight. I think theres still the oportunity for maybe a contact or two from the leftovers right? Good luck and good propagation,
John Paul Dooley W6ZIP

>   Earl

      We've had incredible propagation here all day. My nearest digi has
been deaf for a couple of months, so I usually see anywhere from 5 to 20
stations for days on end. Now, after running for less than 2 hours, I have
73 stations. I CAN HEAR KC5MVZ-2 DIRECT, at 103 miles. I can also hear
KD5JTM-4 at 84 miles, and KB5ZFA-15 at 64 miles! All this in addition to
my usual WA5IHL-11 at 20 miles. Pretty incredible.

      Now, tonight, when I switch to 147.585 and 53.530, the 6- & 2-meter
Meteor Scatter freqs...

      UP & AT 'EM, Y'ALL!!!!!!!!!!!!!!!!!!

      7 3

Don't forget that the Meteor side of the BEACONet project is very
much still in the experimental stages. There is much to learn.
Even no reception reports teach us valuable lessons.

For instance, even thought the number of rocks is about the same
as the Leonids, their speed is significantly slower. Slow speed
mean less ionization. Remember that all meteor showers are not
the same.

Please...stay the course, and play as much as we can over the
upcoming year. We are gathering excellent data to use for years
to come.

I'll be on for one more night (tonight), then I'll share some
thoughts I have about 10-meter (where there appears to be some
interest from Europe, in joining us in some propagation
experimentation) BEACONet trials. :o))

Hi Ev

OK I had another good solar day so I should be good to go tonight and not
sure about Friday night. Ill let you know about Friday the wife told me it
should be mostly clear.

I have been thinking about putting a timer controlled relay in my push to
talk line (from TNC to radio) so that I can Rx all the time and just TX at
certain times. What you think about that idea?

Rich

Rich,
The idea of control-relaying the PTT line is an excellent one.
It does what you need. I'm using a regular ol' appliance timer
on the TNC, but that cuts me off for RX (as you know). Thanks
for sticking with the experiment.

Even with no success during this event, there are more
possibilities in the future (with showers with faster rocks).

By the way...I'll need to cut loose for friday myself. I've got
pressures to try some stuff on 10-meters (with some guys in the
UK) and would like to get setup for doing that over the weekend.

Sig...stand by...I'll announce a frequency shortly (1200 baud
BEACONet on 10-meters...cool, huh?). I'm thinking about 28.128
USB, pending use of nearby frequencies by PSK31 operation.

Regards,
Ev

Hi Ev

BEACOnet! I am in for the long haul.

I am interested in the 10 Meter Beaconet you are working on. When you first mentioned it I was under the impression that it was going to be on 29 MHz FM. No matter where it takes shape I am good to go. I was wondering if a QRP . 5 watt station would be of use to your endeavor? I would love to set up a 24/7 solar powered station for BEACOnet on 10 meters. Let me know if I could help. Also If you could tell me the freq. that you are experimenting on I would love to eves drop.

Thanks
Rich

Since the Quadrantids MS event is virtually over, I am taking this opportunity to update and enhance the METEORegistry web page. Only registration is closed, you can still access the database and maps. There isn't another MS event until April, so now is a good time for me to work on further development.

Hope everyone hit a few rocks!

Rendered body type: text/plain

Hi Rich,
Unfortunately, we (in the USA) can't play on FM-packet on 10-meters (it's not an authorized TX mode). That's why I suggested that we play a bit on 28.128-USB. I'm going to listen on the frequency for a while and see what I get for activity and may power up a bit later today or tomorrow (at 1200 baud).

There are several reasons that I've been resistant to the use of SSB for BEACONet frames...including what I hear is a critical frequency-tuning component. I hear that if you're off by only 100 hz that decoding won't take place. Of course, if the band isn't open, and you have no one to tune against, then it's possible for the band to open later, but still not decode anyone. That's why I'd like to experiment with it a little (I'm a "show me" type of person).

Additionally, there is a group of folks in the UK that are very interested in joining our experiment and are simply waiting for an official "go ahead".

A 0.5-watt transmitter is quite welcome, by the way! If you end-up participating, then I'd likewise want to try a new CQ-To-field experiment with you, too (in which we can embed stuff like RF-power output and antenna type which ought to make later analysis easier).

Thanks for your interest. The geometry between us looks almost

ideal for this type of thing.

Hi Ev

As far as tuning on SSB goes I think that ounce the FREQ is established it
would be easy to get on freq. Most hams know their rigs and know that the
read out might say 28.127.98 to be on frequency. That read out would put my
Yaesu FT-767 on 28.128. My QRP rig is a different story. I do not know what
FREQ read out will be exactly on frequency but I have a MFJ swr analyzer that
will tell me if I am dead on. I think that you see my point. Where there is a
will there is a way. I am like you, show me it can't be done!

It will take some time for me to get the qrp rig going. I need to pick up a
mic plug first. I can use the Yaesu the TNC is set up for it.

I will be glad to experiment with CQ-to-Field. Just tell me what to do and
Ill figure it out. I am quite packet illiterate. Before BEACOnet all I did
with packet was the DX cluster. LOL

I can see a really cool use for BEACOnet on 10 meters after the sunspot cycle
declines. How about multiple E-hops? Not to mention Meteor mode on a dead
band. LOOK out 10 -10 here comes BEACOnet. :-))) Have I got the idea or
missed the big picture?

I set up an RX station tonight on 28.128 it is the qrp rig. I will let it run
and see if I I RX something. Shot in the dark freq.

Rich

Frequency: 28.128 MHz
Mode: USB ***NOT FM***
Baud: 1200
Beacon Rate: 5-minutes (for now)

There are a number of stations in Europe that are interested in
playing with us. It will be interesting to find out if tuning is
as critical as some have led others to believe. Let's see how
many of us can participate in "plug and play" mode...meaning
simply dial-up the frequency, set to USB and see what decodes.

I'm on right now. There's plenty of experimenting to do before
the summer Es and tropo season comes to 6- and 2-meters.

Join me for a while, will you?

Great! Stand by...I've got a "good one" (experiment) to float to
see what happens (To-Field wise). I'll send it along this
morning.

As for your vision...
> I can see a really cool use for BEACOnet on 10 meters after
> the sunspot cycle declines. How about multiple E-hops? Not
> to mention Meteor mode on a dead band. LOOK out 10 -10 here
> comes BEACOnet. :-))) Have I got the idea or missed the big
> picture?

The only problem is that I'm not sure there is a frame big enough
for this picture :o) Actually...you are *right on the mark*! In
hind-sight, I probably should have started on 10-meters earlier
in the project as it is obvious that we are having a difficult
time finding enough forward-thinking folks to join us on 6-meters
(at least enough to form a critical mass to enjoy routine success
there).

I'm particulary interested in Meteor/Saturation Mode on
10-meters. It ought to be like "shooting fish in a barrel", but
that's only a gut feel as I've never shot the rocks on 10
before. Time will tell. :o)

Anyway...stand by...the first of several new ideas is about to
hit the remailer this morning (dealing with the CQ-to-field).

Ditto here. Nothing heard...but I was playing on 223. Don't be
discouraged, though. We're experimenting.

With that in view...and given the geometry of the continent, you
may wish to consider taking the 45-59 seconds after the minute
slot next time. It would really open you up to a bunch more
station. The quadrant method described is a best guess as to how
to time-slot our attempts...not a hard-and-fast rule.

By moving to "Timeslot 4", you open up the folks in New England
as potential fish to catch, too. Just a suggestion. Thanks for
being there!

Rendered body type: text/plain

I have recently learned that both UI-View and APRSdos will allow
us to use the complete To-field for our own purposes, without
affecting the ability to decode-and-display received packets
(unlike WinAPRS, by the way). Most of us (almost all, actually)
use UI-View anyway...so this shouldn't be much of an issue.

This gives us 7-characters into which we can embed information
about our stations, allowing for easier analysis of BEACONet
successes. What I am proposing is that we use the 7 available
characters in the to-field as follows: BSNPAH-D

B = Band
S = Sub-band
N = (to be discussed later)
P = (to be discussed later)
A = (to be discussed later)
H = (to be discussed later)
D = Directivity Vector

Today...we embed the frequency of our operation simply by
appending the major component (MHz) to the end of "CQ". Then we
use the to-field's SSID to embed the antenna direction.

I've come up with a method in which 2-characters can represent
any frequency sub-band "from DC to Light" (well, almost). This
will serve us well, as this service expands to other bands. I've
included the chart at the end, as well as some examples as they
apply to the Amateur service.

I would suggest that we use these designations in place of "CQ"
in the To-field. The frequency resolution seems to be quite
adequate for our work.

See the chart and examples below.

Ev, W2EV

Examples (using frequencies we presently use)
 28.128 MHz = HY
 53.530 MHz = VB
147.585 MHz = VK
223.780 MHz = VS

So...playing on our 28.128 frequency, one would transmit a
to-field of HY-15, if they used an omnidirectional antenna.

In the future... experimenters on the following bands would use
the following frequency designations:
5-MHz = HB (this is the experimental band that the ARRL is
playing with now)
30-meters = HG
160-meters = MO or MP (depending on where in the band)
you get the idea! :o)

==========
Embedding Transmit Frequency in place of "CQ"

B->(X)tra	(L)ow	(M)ed.	(H)igh	(V)ery	(U)ltra	(S)uper	(E)xtr
S	Low			High	High	High	High
|							
v

Message-ID: <LYR1548-128772-2001.01.08-18.00.01--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Ev

I was wondering what the result was form running the beacon's on 10 M
yesterday? I could heir some packet on the FREQ but it was to weak to decode.
I also know that you were heard in TX. I think. I would like to know if
anyone will be running their 10 meter beacon and when?

Thanks
Rich WD4RBX

44. [propnet] Different time slot for KB0OBT (MN)

From: Colleen LaPlante <colleenlaplante@mn.mediaone.net>
Date: Mon, 8 Jan 2001 21:22:04 -0600

Rendered body type: text/plain

Well, Ev, since you mention it I ah (ahem!) did figure out that
transmitting at the same time as the NE quadrant isn't a good idea for me.
 So (since I still suffer from the 'it only beacons for 7 seconds problem')
I was transmitting starting at :55. Hence I was transmitting from about
:55 to about :05.

Some thoughts on the lack of success...
I've worked W8WN on SSB MS via sked on 2M (when I had less of an antenna).
 Shelby runs 1200 W on 2M, and has a 4 antenna array of 16 element KLMs!
 When we got a burn, he was loud and clear, but I don't recall the S meter
if any.

Now, we are using FM (knock off at least 3 dB),
most of us have a more modest station (!) (knock off 6 dB on power alone)
aren't pointed at each other because we aren't sure who we will work (this
is very costly, at least 10 dB if you aren't pointed at me)
are using Packet instead of our ears (at least here, that seems to be big)

On the other hand, I love not staying up listening to static all night
long! Automation means our station will hear the BIG BURN. The problem is
with this number of deductions it takes one heck of a burn to make up for
it.

Still interested though!

>if any.

      The one contact I made on SIX meter SSB/MS, the S-meter was
PEGGED. One of the loudest signals that rig has EVER
received. Unfortunately, the burn died before I got the other guys
callsign, and I never DID figure out who he was. Just a voice (a LOUD
voice) in the night...

      Earl

Oh, BTW, I was MOBILE.

Hi Bryan,
You well-sumarized the differences between traditional meteor
scatter work as accomplished by SSB/CW folks (you and I included)
and BEACONet folks (you and I included <g>).

The thing for other readers to consider is that there is a pretty
good analogy that goes like this . . .
Traditional SSB/CW MS work is to Hunting
as BEACONet is to Fishing

As a result, the equipment and expectations are different. Both
are a load of fun. :o) I'm particularly proud to note that
BEACONet has introduced a ton of folks to the world of meteor
scatter; folks that didn't before realize that, by changing a
strategy a little, they could enjoy the fascination of MS without
having to buy the KW and big beams that the most successful
"Hunters" have.

The mentioning of equipment issues was interesting, too. One
would expect that an SSB signal from a 1200-watt, 64-element
station pointed at you to have "bone-crushing" SSB/CW potential,
even with sub-moderate meteor activity. :o))

You then noted that BEACONet operates automatically, being able
to take advantage of rocks that others may miss. There were
several successes during the Leonids of stations running low
power and simple vertical monopoles (something the 2-meter SSB
folks haven't mustered yet). NOTE: even in BEACONet these
successes are few...more RF is always better in this application.

I hope this isn't coming across as one method is better than
another. I'm a ping jocky in both modes, and having a ball doing
so. For me it's about the Meteors and the signal that I can
bounce off 'em, not the way I find 'em. :o)

We've learned a lot about which showers are more productive,
too. Thanks for everyone sticking through these, even without
reported receptions. It will help us to focus our efforts and
refine our techniques in the future. BEACONet Meteor Mode is
fertile ground for experimenting. It's good to have the willing
community that we do.

Warmly,
Ev, W2EV

starting at :55. Hence I was transmitting from about :55 to about :05.

Did you try the two possible "fixes" to this issue?
* Opening the "Terminal Window" and leaving it open
* Increasing the TX-time (even beyond the 15-seconds) until
  you find one that TX's for 15-seconds

Just curious.

Hi Rich,
I got one reception report from the UK, then my computer system
crashed...hard. "No OS" on reboot. I'm crying (and now using a
"backup laptop" to stay connected with folks on eMail.

I probably won't be back until this upcoming weekend on 28.128,
but please...folks...don't let that stop *you*. :o) 10-meters is
where BEACONet shows extreme potential of demonstration as a
powerful propagation monitoring tool. Join us! :o)

By the way...I need to know something very specific about
our/your 10-meter operation: is it "tune-and-play"? I've heard
that tuning using the SSB mode is extremely critical (needing to
be within 100-hz) or decoding doesn't take place. I'm now
challanging that notion. I'd like to know just how critical
tuning actually is on 1200 baud USB packet. Did you "dial up"
28.128 and play, or did you have to tune-in the activity?

Knowing this has much potential for our future successes.

Thanks, folks! 'See you on 28.128 this weekend.

Ev, W2EV

Hi Ev
I am tune and play (this includes over last weekend). I ran my ten meter beacon today and will do so for the next 4 days on and off mostly on. The rig I am using runs off the grid. I have not RXed any beacons as of yet. This could be bad band conditions.

I have a whistling type of sound on 28.128 but it is weak and should not be a problem.

Unless I missed something beyond VHF I think that it would be quite beneficial to newbies such as myself to know who is participating in HF beaconet where and when. I would love to know who is listening. Just a though. I hate to commit but maybe I can take some of the lode. I am a half butted web master with a commercial site that I can donate some space to the cause.

Boy! I hate to hear about your puter turbo crashing. I had a similar problem today but got her running in short order :-))

Sincerely'
Rich
WD4RBX

Different first line for Lyris...

At 11:21 AM 1/10/01 -0800, Brent Hildebrand blasted the following out into the ether:

>It appears to me that UI-View is encoding position in Compressed format.
>However it is incorrect. The data portion of the packet is:
>=6=)1Q4Ei[# B {UIV32N}
>
>The second character is a 6. It should not be a numerical value. It should
>be either a \ or / for the symbol tables or a lower or upper case letter for
>overlays. Overlay numbers are translated to lower case letters, I think the
>mapping is 0-9 going to a-j.   Someone will correct me if I'm wrong.

      How interesting. Yes, this software is supposed to show a DIGI icon,
with an overlay of "6". When I change it to a "standard" digi, it sends:

KD5XB-6>APRS,WA5IHL-11*,WIDE2:=/=)1Q4Ei[# B {UIV32N}

      The problem here, though, is that is plots some 700+ feet northwest
of actual position.

      Hmm...

      Earl

To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-129222-2001.01.11-15.57.29--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all

Today I was playing with UI-view on 10 meters. I switched to meteor mode for
a short time maybe 2 min. When all of a sudden I got a connect request from
WP4JLU. I did not know how to handle the request using UI-View. His packet
was the strongest signal I have seen sense I started BEACOnet last month.

I think that I have mentioned before that I can hear packets on 28.128
(audio) but they are to weak to decode as far as signal strength goes.

I hope that this information is useful.

Rendered body type: text/plain

Ev,
I've tried increasing the "number of seconds" out to 59 (the max) and I still get just shy of a 10
second transmission.
The 'leave the terminal window open' was a new one on me, I must have missed that suggestion. But still
 no difference.

Maybe something else is wrong?
My terminal window shows that I'm sending a whole bunch of:

19:56:02T KB0OBT>CQ147 <UI C Len=24>:
[EN35KB] kb0obt@arrl.net
19:56:02T KB0OBT>CQ147 <UI C Len=24>:
[EN35KB] kb0obt@arrl.net

Does that look correct?

I'm still in the process of recovering from a catastrophic HD failure
(backups? I don't need no steeeenking backups), but I've managed to get
up-and-running using only a TNC and transceiver. I'll simply check my
MHEARD list every once in a while to see what I received.

I'm particularly interested in the tuning criticality of 1200 baud "SSB"
data communications. Please, "park on 28.128 usb" (according to your
frequency dial) and see what you get without further tuning, would you?

Ev, W2EV
note my new eMail address, too

You presumably haven't taken it out of KISS mode. (Most software that
puts a TNC in KISS mode will take it out of KISS mode when you close the
program.)

Rendered body type: text/plain

Hi all

Just a quick note to let you all know that the 10 Meter BECOnet experiment is
still running. Also this weekend is the VHF contest this would be a good time
to fire up the low band rig and let your 10 meter beacon run for a wile. Tune
and play. Do not tune to the activity. Just tune your dial to 12.128 and let
her go.

As you probably know we have band openings every day from the East to west.
Numbers count, lets get things going so we can see if SSB tune and play will
work! "DXCC / WAS BEACOnet 10 meter beacon experiment". What you all think?
Drop a noter to the group and let us know you are participating.

Another thought, I tuned to 29.250 FM text mode and snagged 2 DXCC countries
in about 2 seconds ;-) Think Ill fire up UI-View with European map and see
what pops up.

Thanks

> I love to experiment and try most things new. hi hi

Hi Colin,
Yes! We are presently running a series of experiments in
intercontinental propagation tracking using UI-View on 10-meters.
Join-in by performing the following modifications to your system setup:

```
1. Delete your Lat/Lon information
2. Place your Maidenhead Grid and eMail address in the
   Beacon Comment field using the following format:
     [IO94XX] email@host.co.uk
3. Place a "frequency designator" and "antenna vector" in your
   Unproto Address field as follows:
     HY-#  where...
           HY = 28-MHz (there exists a table that identifies
                        the 2-character designation for
                        every frequency from 3-kHz to 290-GHz)
           #  = a number that corresponds to the direction that
                your antenna is pointing, using the clock-face
                as your guide.  If omnidirectional, use 15.
     HY-15 = a 28-MHz station with an omnidirectional antenna
     HY-10 = a 28-MHz station with an antenna pointed at North
             America (from the UK)
4. Tune your 10-meter radio to 28.128-MHz (the international
   BEACONet frequency)
5. Set your Beacon Interval to 5-minutes
6. Load a world map and see what you get!

If setup correctly, every 5-minutes your station will transmit a frame
that looks like this:
G0PHO>HY-15:[IO94XX] colin@onslo.fsnet.co.uk
  Assuming that you are using an omnidirectional antenna and
  that you are in grid IO94XX, of course.

The thing to remember is that UI-View is software that may be used for
many purposes.  APRS is one purpose.  BEACONet is another.  The two are
very different services (hence the difference in the way UI-View is
configured).

Come, join-in on the fun!

Ev Tupis, W2EV

65. [propnet] Info - European Signals and UI View on 29.250

```
From: "John Atkins" <john.atkins@110.net>
Date: Sat, 20 Jan 2001 8:45:54
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-130433-2001.01.20-08.59.37--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Just for information. I've found that using UI-View on 29.250 in FM mode, I
usually get decodable aprs signals from Europe most mornings. Usually from
Holland or Greece. They must be "backbone" gateways because after a while,
if the propogation holds up, I also see other stations such as mobiles
appearing also.

I'm using an FT-847 with KAM Plus, set to "software detect mode" and a
6M J-pole at about 25 ft. I'm located about 30 miles west of Boston, MA.

You need to have UI- View set to a world or European map. I found them
quite by accident. I was listening one morning to what sounded like very
```

distant packet on 29.250. I decided to fire up UI-View to see if it did
anything. I saw nothing appear on the map (US - my default). I then brought
up a world map for something else I wanted to do - and there they all were
- a bunch of stations all clustered around Western Europe.

Yes, there's quite a lot of us on 29.250 NBFM over here. I've had up to
80 stations on my map on many days in the past few weeks, most heard via
the SV2 digi. It's far more than I see on 2m!

Yes! Another 29.250-lurker! I've done the same thing, John. Then I
did some research to find that the USA is not authorized to transmit on
29.250-MHz using FM. :o(Besides, this is a European APRS frequency.

So...that's the drive behind two things...
1. The establishment of 28.128 USB ('cause we can play there)
2. A thought of writing of a Petition for Rule Making to see if
   the FCC would be interested in allowing US hams to use FM data
   in the sub-band from 29.2 to 29.3.

Anyone other than John and I lurking on 29.250 (RX-only in the USA)?

Ev, W2EV

> Is there a WEB site with more info?
> Jack Chomley
> VK4JRC

Hello Jack,
We're using 1200 baud packet. The website is: http://go.to/BEACONet.
If you go there, you'll find information on using BEACONet for
propagation study and meteor scatter work (!) on 6- and 2- meters; along
with some sample maps from the USA of meteor successes.

We've just recently started playing on 10-meters. Due to FCC
restrictions, we may not use FM for data communications on that band, so
we use USB on 28.128.

I've cc:'d this note to the BEACONet/PropNET remailer, just in case some
of our west coast USA participants are interested in knowing that there
may be some VK activity coming their way.

Thanks for asking!
Ev, W2EV

> PacComm Tiny 2 (bell 202 tones) and a HTX100 Tandy 10 metre radio..
> ...can run unattended OK here.
> What information do you want in the beacon text?

Participation is easier than you may be thinking. On BEACONet, all we
use is the 6-character gridsquare between brackets. Do that by deleting
any lat/lon information, and placing your grid in the beacon text area.
Also, we embed frequency and antenna info in the To-field.

If setup successfully, you will transmit packets that look something
like this:

```
VK4JRC>HY-15:[GR##ID]
       ^^ ^^  ^^^^^^
       || ||  ++++++--- Your grid
       || ++------------ Antenna pointing direction, using a clock-face
       ||                as your guide.  East=3, etc.  15=omni
       |+--------------- means the 28-MHz sub-band of the 10meter band
       +---------------- means HF (3-30 MHz)
```

Setup to TX every 5-minutes and see where the propagation gods take your
signal. :o)

As mentioned earlier, BEACONet is a service that uses UI-View software.
APRS is a service that uses UI-View software. The two services have
different purposes: one is a "tactical and emergency communications"
service (APRS), one is a "propagation study and analysis tool"
(BEACONet). Each is configured for use in such a way as to best
accomplish its stated purpose.

I just read some of my PropNet digests and found this digest very interesting. I found a friend mentioned on the web pages, that lives near me.

This sounds like fun. I downloaded the software, hope to install it soon. I have 28.128 on and monitoring (audio).

Hope to see and hear you all soon.

Rendered body type: text/plain

Hi all,
I am now configured as a "Level II" system with antenna pointing at Los Angles from CM87XH. FT847 @ 100 watts into a 5 element bean at 30 ft above ground, every 10 minites. (00:,10:,20: min. etc.) I will let this run for a few days, (or until TVI complaints are received, hi hi). Is anyone else doing just level II during the "Off times" when no meteor activity is expected? Note I am not doing bursts each minute. Reception reports appreciated!!

Hi Wayne!
Welcome aboard! There's a station in New Mexico on 24/7. If you have a
clear shot in that direction, you may want to give that a try, too. Of
course, this is the poorest time of the year to take advantage of Es,
but ya never know.

Ok...I hate to sound desparate. :o)

I'm in the process of buttoning up a BEACONet article that is slated for
spring publication in a major US magazine. I need some actual screen
shots of DX receptions (non-meteor for this article) on 28.128 MHz.

10 meters is open most days. I would like to include screen shots of
what the system is capable of providing (with more than one or two
icons). It's time to make the transition from theory to practice.
Please...if you are able to activate on 28.128 USB, 1200 baud using
BEACONet protocol (note 1)...it's time to do so.

You may see a graphic in <a major magazine> with your icon on it!

Ev, W2EV
W2EV>HY-15:[FN03XD]

Note 1: visit http://go.to/BEACONet for more information. Remember, all
we need to do is launch packets that look (minimally) like this:
CALL>HY-#:[GR##ID]
^^^^ ^^ ^ ^^^^^^
|||| || | ++++++-- Your 6-character Grid
|||| || +---------- Antenna pointing vector (by the clock-face,-15=omni)
|||| ++------------ H= HF, Y=28-MHz
++++--------------- Your callsign

Hi Colin,
Don't give up on us. 28.128 is a brand new frequency, without a lot of
advertising behind it yet. I'm going to try to advertise it in a big
way.

I am getting re-activated on the frequency this afternoon myself (I
needed the tower space for a North American VHF contest last weekend).

'hope to see you (and as many other Region 1 folks as possible) on the
map soon!
Ev, W2EV

> Don't you mean 300 baud?

Hi Ben,
No, it's 1200 baud. Part of the "experiment" is to see if 1200 baud
makes things more easily tuned than does 300 baud. So far, it looks
quite forgiving. Join-in, if you can!

Rendered body type: text/plain

Hi Folks,
Here's a note that I got from a ham in Europe. With any fortune, we'll
have plenty of stations to plot in the upcoming several days. Please
power-up if you can.

Ev, W2EV
W2EV>HY-15:[FN03XD]

I have powered up on 28.128 mHz this morning (1-30-2001).
Running 75 watts to a GAP vertical using the TS570SG. I
was hearing a weak station earlier which was probably
WD4RBX/QRP, Rick, about 25 miles away. Hope condx improve so
he will print on the screen.

93. [propnet] 28.128 MHz report

From: RickfordG@aol.com
Date: Wed, 31 Jan 2001 10:36:45 EST
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-132124-2001.01.31-09.50.48--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all

This morning I found a problem with my radio. The ext. speaker jack was
faulty (fixed now) and Ill bet I didn't RX a lot of stations because of it.
After KJ4X had mentioned that my signal was weak I checked and found that for
the last 3 weeks my transmit power was at half throttle about 10 watts. I am
running 25 now.

Here is my RX list so far.

94. [propnet] 28.128 MHz UI-View/BEACONet Successes!

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Wed, 31 Jan 2001 21:52:44 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-132213-2001.01.31-21.06.46--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The BEACONet system works (see the note after the next section)!

Please, join-in on the experiment!

Use UI-View...
...remove lat/lon information
...place your 6-character Maidenhead Grid between brackets and your
   eMail address in your Beacon Text.
     Example: [IO94XX] email@host.com
...replace your Unproto Address with HY-##, where H=HF, Y=28 MHz and
   ##=antenna pointing direction, using a clock as a guide. 3=East,
   9=West, 15=Omnidirectional
...Beacon Interval Fixed = 5
Tune to 28.128 USB, 1200 baud and let things play! Report what you get;
the experiment is "on".

Power-up and join-in on the fun...if you get more than one or two
stations on your screen, take a screen-shot (along with a station list
showing the DX involved, if you can) and forward it to me. I'd love to
post it on the BEACONet website.

Here's a note from Rich (WD4RBX) that was recently sent to TAPR's
BEACONet/PropNET listserve:

Hi all

This morning I found a problem with my radio. The ext. speaker jack was
faulty (fixed now) and Ill bet I didn't RX a lot of stations because of
it. After KJ4X had mentioned that my signal was weak I checked and

I got home to find N0ELS>HY-3:(EM15GH)... on my screen. Last heard at
10:22 am. EM15 to FN03 = 1879 km. Thanks for being there!
Ev, W2EV

By the way...it looks like you used parentheses "( )" rather than
brackets "[ ]". Although UI-View doesn't care, other software that
folks may be using may not decode it properly. Be sure to use square
brackets.

Please power-up, Region 1 folks. It would be really neat to have a
screen full of icons this weekend!

Ev, W2EV

Launch UI-View and . . .
. . . remove lat/lon information
. . . Unproto Address = HY-##
        where, H=HF, Y=28 MHz and ##= antenna directivity using
        the clock-face as your guide. 3=East, 9=West, 15=omni
. . . Beacon Comment = [GR##ID] email@host.com
        where [GR##ID] is your 6-character Maidenhead Grid locator
        (be sure to put it between brackets as shown), followed by
        an eMail address to make QSLing easy
. . . Beacon Interval Fixed = 5
. . . Tune to 28.128 MHz USB and you are 1200 baud BEACONet active!
For more information, visit http://go.to/BEACONet

Rendered body type: text/plain

How cool, Earl! It sounds like VHF is hot across the southern tier of
states lately. It'll be nice to return to spring and summer again.
Ev

Rendered body type: text/plain

Now that we're all comfortable with using a two-character frequency
designation in our Destination-field (rather than CQ), it is time to
look at embedding a little more information.

Eventually, it will be nice to know who can and cannot relay information
(commonly called digipeating). Why digipeat? Easy! The band may be
"open" to a BEACONet station that is in line-of-site range of you, while
the band is not "open" for you. Wouldn't it be nice to know that
conditions are building, even if you aren't in the "skip zone" yet?

I'll use a future eMail to further describe this function and how it is

used (if you are curious, drop me a direct eMail and I'll explain it via
direct-reply). I don't want to overload general users with too much
information to digest right now.

The next character is called "Network Personality" and is 1-character in
length. It is Alpha-Numeric in nature, and will be capable of
identifying the "personality" or combination of "personalities" that
your station exhibits on the BEACONet network (yes, we're eventually
building a network <smile>). The bad news is that this is still being
developed and defined. The good news is that there are only two valid
values (today): "0" and "1".

If your station is setup according to the "Level-II" instructions on the
BEACONet web site, then the value is "1". If not, the value is "0".
More "Network Personalities" will emerge over time, but for now, this is
all we need to know.

So...with this eMail, please add one character to your To-field as
described above. The syntax is now:

```
BSN-##
||| ||
||| ++-- Antenna Directivity, using the clock face as a guide
|||      ( 3=East, 12=North, 15=omni)
||+----- Network Personality (1=Level-II directions followed, 0=not)
||       If using UI-View, be sure to follow those "Level-II"
||       instructions.  If using TNC-only or software other than
||       UI-View, then use "0" (zero) for this character
|+------ Frequency sub-band of operation (Y=28 MHz, B=50 MHz,
|        K=147 MHz, S=223 MHz)
+------- Frequency band of operation
         (H=HF [3-30 MHz], V=VHF [30-300 MHz])
```

So...
A 2-meter participant, with an antenna aimed roughly South West, using a
Level-II configured UI-View station would use: VK1-8.

A 10-meter participant, using only a TNC (a Level-I participant) to an
omnidirectional antenna would use: HY0-15

I'll let this soak in for a bit...then it's off to embedding cool stuff
like RF Output and Antenna Gain in the next couple of characters!

Rendered body type: text/plain

Folks,
If you were active on 28.128 MHz USB today, please take a screen shot of
your results and send it to me (either .jpg or .bmp is fine...zipped or
not).

Before you do...please do the following:
1. Open a "Stations" window. If you see anyone from another
   continent there, then use the world map to display (available
   from the BEACONet website http://go.to/BEACONet under the link
   titled "Fast Links".
2. Set the Stations window to display DX in km rather than miles
   (there's a button at the bottom of the window for that)
3. Make sure the "black bar" in the Stations windows is on YOUR
   station
4. Move or resize the Stations window so that it is not covering
   any icons

A full recap of the weekend's screen shots will be posted for others to
see. An analysis will be interesting, to say the least!

Thanks for all of your efforts!
Regards,
Ev Tupis, W2EV

18. [propnet] digipeat... how about e-peat?

From: Colleen LaPlante <colleenlaplante@mn.mediaone.net>
Date: Mon, 5 Feb 2001 18:01:00 -0600
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>

Message-ID: <LYR1548-133168-2001.02.05-18.13.59--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

For myself, I'd rather have a way to e-peat the opening info (some of us
are at work, not watching our home station). With a little software magic
we could capture the opening information and broadcast it via e-mail (which
means also to pagers and to the newer cell phones).

Some requirements:
Filtering - if I don't have a 10M station, then 10M contacts aren't going
to interest me at all.
        - maybe I only want to see contacts that have an end-point 'near' me
Subscribe / Unsubscribe via a self - serve web interface
Run reports showing openings by time of day, distance, etc. Be able to
drill on any line and get more information.

I can build the database of contact information, but a database needs
data... how do we get that data to my database?
What I can provide: NT Server, on the internet, with database software.
 Database design, etc. Quite a lot of what I'm talking about is in
commercial products which I work with.

Think about having your pager go off when 2M opens and your home station is
working DX!

Now THIS is some excellent, creative thinking . . .

> With a little software magic we could capture the
> opening information and broadcast it via e-mail (which
> means also to pagers and to the newer cell phones).

I like the later mention of filtering options and web interface, too.
It makes sense.

So...with creative juices flowing, it would be interesting to know if
this exists (even as a near miss) in the form of an add-on product
called "UI-Path". I understand that it is a "plug-in" for UI-View that
will trigger an outside event, should a certain parameter be tripped by
your computer at home.

Yes, I know that Bryan was specific about this being an Internet site
for this function, as a central point for this service. I'm simply
suggesting that someone check out UI-Path (I don't remember the URL,
sorry) to see how/if something similar is implemented there and how/if
it helps in understanding how to implement the web-based thing.

Good thinking! What you suggest could be a valuable service to the
BEACONet community!

23. [propnet] Re: Europe <-> North America on 10 again

From: RickfordG@aol.com
Date: Tue, 6 Feb 2001 18:53:36 EST
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-133437-2001.02.06-18.08.05--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

You can add a new station to the growing list.
This morning a new icon popped up on my screen. +IK2CHZ. Not sure if he heard
my 25 watts but he did hear W2EV and I think N1NCO.

Packet newbie Question.

What does the + 0r - in front of the call sign and the different color icon
mean UI-View?

Thanks
Rich
WD4RBX

24. [propnet] UI-View setup for BEACONet operation

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Wed, 07 Feb 2001 06:43:31 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-133539-2001.02.07-05.57.47--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

> What does the + 0r - in front of the call sign and the different
> color icon mean UI-View?

Quick note about UI-View. It is well written with excellent
documentation. When viewing a "Stations" window, simply press <F1> and
help dialogue for that function will pop up. Rather than re-hash it all
here, take a gander. It is extremely interesting.

Now (from the practice what you preach department) I also need to say
that I misunderstood the "UI-View Extensions" option. Please make sure
that this is ENABLED, as it will provide BEACONet functionality that is
otherwise not available. Under Setup|APRS Compatibility, UN-check the
option that says "No UI-View Extensions". You'll get greater function
from your BEACONet station by doing so.

To understand what you get by doing so, check out the <F1> help with the
"Stations" window open.

Thanks, Roger, for those BEACONet-friendly UI-View functions!

26. [propnet] BEACONet Protocol: RF Output Character

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Wed, 07 Feb 2001 20:18:44 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-133769-2001.02.07-19.33.05--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

OK, here's the BEACONet Protocol so far:
BSN-#
B=Band (H=HF, V=VHF)
S=SubBand (Y=28 MHz, B=50 MHz, K=147 MHz)
N=Network Personality where...
  1 if you are using UI-View and followed all of the setup
    instructions as found on the web site (http://go.to/BEACONet)
  0 if any of the above is not true
-#=Antenna orientation using the clock as the model
   -3=east, -6=south, -15=omni

There is more information that can be useful in studying propagation
paths. For instance...why can you copy a lot of other stations, but no
one seems to be able to copy you? Maybe they're running more power!

The chart below shows you how to embed your RF output into your
Destination-Field. All it takes is one character to represent any
output power level from 1-milliwatt to 32-Megawatts!

====================================
Actual RF Output (Not ERP)
----
0 - 1mW   A - 1W K - 1kW U - 1MW   mW = milliwatt
1 - 2mW   B - 2W L - 2kW V - 2MW   W = Watt
2 - 4mW   C - 4W M - 4kW W - 4MW   kW = kilowatt
3 - 8mW   D - 8W N - 8kW X - 8MW   MW = Megawatt
4 - 16mW   E - 16W O - 16kW Y -16MW
5 - 32mW   F - 32W P - 32kW Z -32MW
6 - 64mW   G - 64W Q - 64kW
7 -125mW   H -125W R -125kW

```
8 -250mW   I -250W  S -250kW
9 -500mW   J -500W  T -500kW
====================================
The value above should be understood as "starting at this level
and continuing until the next level is reached".  A power level
of 50-watts is assigned a value of "F".  A power level of 63-
watts is assigned a value of "F".  A power level of 64-watts is
assigned a value of "G".  Power levels that are lower than 1mW
are defined as "0" (zero).

So...the Destination-field is now defined as:
BSNP-#
|||| |
|||| +-- Antenna direction (clock-face model)
|||+---- Power Output (from the chart above)
||+----- Network Personality (0 or 1 as noted above)
|+------ Sub-Band (frequency)
+------- Band (Hf, Vhf)

So, some examples of Destination-Addresses:
Freq   Network Personality  Power Output  Antenna  Config Code
----   -------------------  ------------  -------  -----------
28.128 UI-View fully config 100 watts     Omni     HY1G-15
28.128 TNC Only              25 watts     East     HY0E-3
53.530 UI-View fully config  75 watts     30-deg   VB1G-1

As you can see, this goes a long way to determining just why some
stations are decoded alot while others are not...maybe. :o)  After the
dust settles a little on this, I'll float the next character: Antenna
Influence (as in gain).

Comments?

29. [propnet] 28.128 USB for the weekend

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Fri, 09 Feb 2001 19:44:40 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-134226-2001.02.09-18.59.14--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Let's try another shot at activating on 10-meters for this weekend,
Europe! North America is ready for anything that comes across the
ocean. Africa and South America are welcome to join-in, too! Anyone in
Australia? We're watching!

Use UI-View configured as shown in the message footer. Join in on the
fun!

Ev TupiS, W2EV

Launch UI-View and . . .
... remove lat/lon information
... Unproto Address = HY-##
      where, H=HF, Y=28 MHz and ##= antenna directivity using
      the clock-face as your guide. 3=East, 9=West, 15=omni
... Beacon Comment = [GR##ID] email@host.com
      where [GR##ID] is your 6-character Maidenhead Grid locator
      (be sure to put it between brackets as shown), followed by
      an eMail address to make QSLing easy
... Beacon Interval Fixed = 5
... Tune to 28.128 MHz USB and you are 1200 baud BEACONet active!
For more information, visit http://go.to/BEACONet

Watch for:
 W2EV>HY-15:[FN03XD] w2ev@rochester.rr.com
on 28.128 USB!

Hi all
10 is the quietest I have heard it in a long time the back ground noise is
zip. The band is open to Europe and so far this morning (8:15 eastern) I have
RXed OH4MM and G0PHO consistently. Looks like a good day for the network so
if you can, Fire up the rigs.

I am playing with my 10 meter beam the reflector is on the ground and the
last director is about 3 feet off the ground and I can RX the stations
mentioned above. Looks like you can work Europe with a wet noodle today.

Have a super day!

Rendered body type: text/plain

The band seems to be wide open and I have a good packet signal from
LA8UU in Norway. (Displayed on UI View) He's the only one I have at the
moment. There seems to be very heavy QRM on 28.128 - mostly RTTY on or very
near the frequency. I suspect that these other signals are confusing the
TNC. Sounds as though there is some RTTY contest going on, if so it may
reduce the number of contacts this weekend.

Rendered body type: text/plain

I'm fairly new to the list, but since the list is also fairly new... this
probably hasn't been talked about.

I'm a U.S. citizen living in Irkutsk, Siberia. Soon I will be moving to
Olkhon Island in the middle of Lake Baikal. I would like to start a "Radio
Sport Club" for the kids there. This would be good since there are no
telephones, the 1-11 grade school has about 300 students, who are in need
of connecting to the world and to other kids on Baikal.

While setting up a 28.128 beacon would seem to be a high priority - while
there are still a few sunspots - what I'm really interested in is "tropo
enhancement" caused by the cool water of the Lake often overlayed with
warmer air. This given that Baikal gets more sunshine for the latitude (53
degrees) than anywhere else on the planet! And because the old soviet
central diesel plant is often in need of fuel - it's a great place for
photo-voltaics and windpower ;-)

So one of the first things is to set up a 2 meter APRS/PropNet
criss-crossing the Lake to do some studies. I am interested in
communicating with anyone with "over lake propagation" experience. Most
likely Great Lakes residents. If anyone would like to share their
experiences or learn more of things here, please send e-mail or check out
http://www.nerpa.net/ESO

73 to all,

O.J. Lougheed, ex-N5JXU

Sorry! I got that wrong. It isn't needed for the latest version, the LPT
driver is included in the main program.

I played around with it for weeks off and on, trying to interface it to
UIview and Im mystified. Some computers it works on. Some it works on for a
while and quits. I emailed the author for some advice and never got a
response.
I was attempting to setup a simple way so anyone with a soundcard and a
scanner could watch APRS in action. No transmit required.
I have come to the following conclusions:
Maybe some other day with some other software. The project is officially
dead from my view. I had intended to come up with a simple document, but
the equipment did not working as advertized, case closed.

Gave it the good try, it doesn't work for me that is, on a P233, A P90, a
AMD166 or an Intel 133...Ive got other things to waste time on..

>likely Great Lakes residents.

Hi OJ

I have been running APRS (APRSPlus) now for many years in the Detroit Metro
area (25 miles northwest of Detroit), and regularly experience lake enhanced
propagation.

I have a station with a 4-element quad pointed toward Cleveland over Lake
Erie, and I receive direct packets from the Cleveland stations everyday (120

mile path). It is not uncommon for me to receive packets from Erie and
Pittsburgh, PA also, but this is not a regular occurence. I can also
reliably communicate direct with Cleveland stations by shooting over Lake
Erie- but sometimes we have to wait for the path to open for the direct shot
(like meteor scatter, except the "openings" happen several times a day as
weather patterns traverse the lake).

My current power output is 100 watts, however, the same regularity of
contact is evident with just 45 watts. Storm fronts can be especially
exciting as my heard Direct list soars to 50 or 60 stations, many of them
over 100 miles away.

If you aren't in a hurry, APRS is a great way to send information as
conditions permit. If you don't get through, just leave the message there,
and when conditions change such that the target station i sheard again
(hours or even days down the road), the message reactivates and get sent
again. Wonderful since the system waits for conditions to improve.

Good luck

Rich, N8QLT

I find AGWPE with a sound card works quite well. I've used it on a
K6-2/450 with a cheap mobo with onboard sound, and I've used it on an
Athlon 700 system with an SB16 PCI card. I don't use it all the time,
because I've got plenty of TNCs available, and I prefer to use Windows
sound for other things. The following might help:-

1. You should use the most recent version of AGWPE - 2000.78.

2. You need to enable line-in in the Windows volume control record
properties.

3. In the AGWPE Properties for the port, "SerialPort BaudRate" should be
set to 1200.

4. Make sure that you select "SinglePort", unless you really want to use
two ports, and that you are inputting on the correct channel - the left.

5. If you want to use the LPT port for the PTT, then you need to put
agwlptsc.vxd in the AGWPE directory. It's in agwlptsc.zip, which is in
drivers.zip.

6. It's best to disable other Windows sounds, because with at least some
sound cards they can cause a fatal error.

7. The two most common problems I've seen with AGWPE and a sound card
are -

(a) Not enabling line-in in the record properties.

(b) Not using a valid PTT port. If the AGPWE "RadioPort Selection"
dialogue shows the word "idle" in the port description, then it doesn't
like your PTT selection, and the sound card modem is disabled.

I'd like to get the validation number for UI-View, so I can be a
"verified" UI-View user of the TCP/IP stream. Anybody remember how to get
this?

      Thanks,
      Earl

There's a chance that BEACONet will be featured in an upcoming issue of
an Amateur Radio magazine. To help nudge things along, I thought it
would be nice to submit a UI-View screen shot filled with icons from all
around the world. Maybe they'll use it on the cover? I don't know, but
it's worth a try!

Here's your chance at fame! Please BEACONet-ers...we know that the
concept works...it's time to show your conviction. The window of
opportunity is relatively small (only a couple of weeks, actually).
Activate on 28.128 USB this weekend, invoking the LOGing function. With
any luck, we can get a couple of dozen icons on your screen from all
over (I just had an inquiry from Brazil this morning, by the way). Take
a <PrtSc> screen shot and send it to me if you have more than 8-icons on
your screen. Likewise, send me your .TXT logfile, too. I'll submit the
best couple as a followup to the article (which was just submitted this
morning).

Ramp up for activity Friday, Saturday and Sunday (that is, if you can't
just power-up and leave things running before then anyway). Join us!
You may just see your icon on a map in a major magazine!

When you first launch UI-View, it greets you with a splash screen saying
that it is an unregistered copy and to press F1 for registration
information. You can register with a credit card, online. Roger will
be back to you typically within 24 hours with your own registration
number.

Hi all

My monitor decided to put a birdy on 28.128MHZ. I could not find the reason
for this. The only solution to the problem so far was to turn the monitor
off. I have never tried to run a computer this way before and so far it seems
to work. Any ideas or comments would certainly be appreciated

50. [propnet] BEACONet future Internet-database vision

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Tue, 13 Feb 2001 17:17:20 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-134883-2001.02.13-16.32.04--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

A previous message from Bryan (KB0OBT) got the creative juices flowing
again. Now that we can fully document Frequency, Power, Antenna
influence, etc in each of our transmissions ... it may be time to start
thinking about an internet database to which we could either:

1. Upload our log files
-or-
2. Connect to in real time (similar to the APRS services' IGates)

Of the two...I've got to believe that Option-1 should be an easier
implementation, since people could simply upload log files from time to
time at their leisure. The host could accept the log file, and re-parse
it into a format that would make analysis easier (whatever that means
<grin>).

In order to assure that we have a useful amount of data to analyze, we
will need to establish some 24/7/365-participation stations: HUB-class,
in our lingo. A Hub-class station is simply a Kantronics KPC-model TNC
with ROM 8.2 or greater, configured as a "Level-I(h)" station, a
transceiver and an antenna (no computer needed). See the note at the
bottom on how to configure a "Level-I (h)" station.

Given what we know about the footprint of HF and VHF propagation
anomolies, a "critical starting mass" would be something like:

Band	Number of 24/7/365 Hubs
10-meters	10
6-meters	35
2-meters	100

With this number of Hubs, evenly distributed across the North American
continent, we will be the envy of the propagation tracking community.

Funny enough, there are at least this number of CW beacons in existance
already. Yet, because of the limitations of CW propagation beacons, a
relatively small number of people actually utilize them.

Let's make a push to use this year to establish our core network! Let's
talk up all of the inexpensive transceivers that could be used on each
band. If you know of a CW beacon operator, introduce them to the
BEACONet concept. Imagine the system that would be established if we
could convince only 10% of them to come aboard with BEACONet!

Ev, W2EV

> My monitor decided to put a birdy on 28.128MHZ.

This is usually associated with scan rate or shielding. Try
disconnecting and reconnecting your monitor plug (it may simply be
oxidized). Do the same thing with all of your connecting wires,
actally...you never know which one is doing the radiating.

Then try a different screen resolution.

Additionally, a ferrite bead or two on the monitor line is a good
thing. You may even want to try coiling the monitor cable tightly if
you have enough to spare.

Barring that, a lead impregnated apron (a' la X-Ray technicians) around
the monitor should do the trick. :o)

Good luck!

52. [propnet] Hub Configurations & To-Field Prococol Recap

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Tue, 13 Feb 2001 22:43:00 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-134915-2001.02.13-21.57.42--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

We need to establish some 24/7/365 stations in order to enjoy long-term
success. Computers are not required, only TNC's, transceivers and
antennas. These "stand-alone" stations are called Hub's in BEACONet
lingo. They exist as "Hubs of RF signals" that BEACONet-ers can count
on receiving, should the band open.

Ev Tupis (W2EV)

===== Peer-class HUB (the best kind) ================================
All it takes is a Kantronics KPC-model TNC with ROM 8.2 or above, a
transceiver and an antenna. These commands will not work for any other
make/model of TNC.

Invoke the following commands:

RESTORE D	Restores factory defaults
INTFACE TERM	
BLT 1 [GR##ID] email@host.com	Place YOUR grid between square brackets and YOUR eMail address afterward
LTP 1 BSNPAH-#	Calculate your BSNPAH-# Configuration Code based on the table at the end of this eMail. Be sure to use the N-value of "1" (one).
LT 1 EVERY 00:05:00	Send once every 5-minutes
UITRACE HOP,60	Setup for future BEACONet function

```
There are commands that will disable the on-board BBS, but I can't
remember them.  It would be good to invoke them, too.  We don't want
traditional "connected packet" clogging up the BEACONet frequency. :o)

If setup correctly, this Peer-Hub will transmit frames that will take
the form of:

CALL>BSNPAH-#:[GR##ID] email@host.com

By the way...this is called a "Peer-class" Hub because of the UITRACE
command.  Without it, it is a "Client-class" Hub.  More on this next.

===== Client-class HUB (the next best kind) ==========================
These commands should work for any TNC2 or clone.

Invoke the following commands:
RESET                          Restores defaults
MYCALL W2EV                    Place YOUR callsign in place of W2EV
BTEXT [GR##ID] email@host.com  Place YOUR grid between square
                               brackets and YOUR eMail address
                               afterward
UNPROTO BSNPAH-#               Calculate your BSNPAH-# Configuration
                               Code based on the table at the end of
                               this eMail.  Be sure to use the N-value
                               of "0" (zero).
BEACON EVERY X                 Substitute for X, whatever value your
                               TNC requires to transmit once every
                               five minutes.

If setup correctly, this Hub will transmit frames that will take the
form of:

CALL>BEACON:[GR##ID] email@host.com
                               Notice the lack of information in the
                               To-field?  This is one reason why a
                               Client-class HUB is not as useful as a
                               Peer-class HUB (above).  Yet, *some*
                               signal is better than *no* signal. :o)

======================================================================
Calculating your BEACONet Configuration Code
----------------------------------------------------------------------

BSNPAH-#
^^^^^^ ^
|||||| |
|||||| +- Antenna Directivity, using the clock-face as a guide.
||||||                         East = -3, South = -6, Omni = -15
||||||                         North= -12, but -13 & -14 are unused
|||||+--- Antenna Height Above Average Terrain
|||||          0=0+ ft     4= 80+ ft     8= 1280+ ft
|||||          1=10+ft     5=160+ ft     9= 5120+ ft
|||||          2=20+ft     6=320+ ft
|||||          3=40+ft     7=640+ ft
||||+---- Antenna Gain/Element Count (element count is preferred)
||||           A= 0dBd     0=  1  element
||||           B= 3dBd     1=  2+ elements
||||           C= 6dBd     2=  4+ elements
||||           D= 9dBd     3=  8+ elements
||||           E=12dBd     4= 16+ elements
||||           F=15dBd     5= 32+ elements
||||           G=18dBd     6= 64+ elements
||||           H=21dBd     7=128+ elements
|||+----- Power Output (only the most probable values are shown)
|||            E=16+ watts  H= 125+ watts
|||            F=32+ watts  I= 250+ watts
|||            G=64+ watts  J= 500+ watts
|||                         K=1000+ watts
||+------ A value of "0" (zero) denotes a Client-class station,
||        meaning that it is not capable of processing HOPn-N
||        requests for digipeating (a future BEACONet function).
||        A value of "1" (one) denotes a Peer-class station, one
||        that is capable of processing HOPn-N requests.
||
++------- Use the following Alpha values for the corresponding
          BEACONet frequencies in the Amateur Service:
          HY =  28.128 MHz USB
          VB =  53.530 MHz FM
```

VK = 147.585 MHz FM
VS = 223.780 MHz FM

I keep the Beacon net "user" database, I would be willing to consider
managing the database you describe.

Hi All

I configured my MFJ 1270C as a Client class hub. I will run 24/7/365. Also
The 1270C does transmit the To-field instead of the word "Beacon"

Hi folks,

I've been running 24/7 in this mode (VK1HD3-2...147/UI-View/180w/10dB/40'
pointed toward Ev in Rochester) northwest of Detroit since early November,
and plan to leave it going as a hub (I've been running an APRS IGATE 24/7
here for the past 3 years, and BeacoNet compliments the whole thing nicely).

I'm going to try setting up for the 10m activity this weekend too running
100w to a dipole.

Rich

Rich,
I can hardly wait for the spring time. I've been waiting for some good
conditions to build to see just how often we see each other. Thanks for
sticking with it! I'm on the air, too...pointed your way as a Peer-Hub
(using a Kantronics TNC).

Maybe 'see you on 28.128 over the weekend, too! :o)

58. [propnet] Propagation Database

From: Colleen LaPlante <colleenlaplante@mn.mediaone.net>
Date: Thu, 15 Feb 2001 21:05:40 -0600
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-135365-2001.02.15-21.17.58--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Ev and Richard,
Some thoughts about the propagation database....

1) I don't think we need 100 2M hubs, if some of the hubs are connected to
the internet. What I was originally thinking was that each hub would
automatically report information to the database. In the mid-west, one
internet connected hub per state would be sufficent coverage for any
unusual 2M openings. Even data from a single station with good ears would
be useful.

2) I've got a database 90% designed to hold the data. Conveniently at work
I currently evaluating a tool that would allow us to query this data from a
web page, without the users knowing anything about databases, and without
my doing any coding. If we used that tool, I'd have to host the data due
to licensing issues. My hosting the data here isn't any big deal, but, see
the next item.

3) Richard, I don't have any quick and easy way to take someone's upload
and load it into the database in mind. Suggestions, ideas, help all
welcome. You probably should contact me off-list.

I'm still thinking about real time notifications!

This is great news! For the uninitiated, Rich is the one that developed
the METEORegistry page that we use to coordinate our Burst-mode efforts
around the meteor showers (http://go.to/METEORegistry). Of course,
there's plenty of room for anyone who has the programming skill to
participate, too. Even so...thanks for the willingness, Rich!

This might be a good time to continue this thread with some vision as to
how such a system would work, and present it's results.

My thoughts were to keep it simple, but effective. Provide a method of
simply uploading log files from time to time and have the site parse-out
the unnecessary stuff (all of the transmissions from the "host"
station), leaving all of the time/date stamped receptions (along with a
tag as to who the receiving station was, for later analysis).

The question is a matter of how best to analyze the data. I've got a
couple of ideas, but let's open this up a bit to other remailer
subscribers, too. Any thoughts, gang?

Rendered body type: text/plain

Hello All,

I just setup a 10m station to run on 28.182 this weekend, with 25w output.
I'll be finishing a better 10m dipole this evening and putting that up later
tonight or tomorrow morning.

Unfortunately, I haven't paid attention to the discussion when folks were
talking about running multiple radios and TNCs with UIView. I thought there
was a way to hook TNCs to COM1 and COM2 (or 3) and run the program that way,
or maybe you have to run two copies each using a separate COM port, I just
need a hint or help to get it going. I'd like to run the 2m and 10m
stations together on the same computer, 24/7/365 if I can.

Anyone? anyone? Beuhler?

Rich

65. [propnet] How best to analyze the data, when it gets into our database

From: Colleen LaPlante <colleenlaplante@mn.mediaone.net>
Date: Sat, 17 Feb 2001 09:29:09 -0600
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-135658-2001.02.17-09.41.20--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Ev, and all,
The database I designed to hold the current propagation data would keep
track of:
Sending call, power, antenna info, grid, date, time, band
Recieving call, antenna info, grid, date, time.

The tool I'm hoping to deploy for you would allow any one of you to query
this data IN ANY WAY you'd like. So if today you decided you'd like to see
a plot of contacts on 2M of more than 500 miles, as a bar graph, with a
count on the Y axis, and the month on the X axis... you could create that
in a simple wizard interface. So with this type of 'ad-hoc' tool, we don't
have to figure out what reports and analysis we want to see before we start
building. And if a new analysis is desired we or you can build it quickly
(typically 5 minutes unless it is a very complex question).

The one thing I have to do is try to forsee all possible ways you might
want to 'slice and dice', and make those all possible from the way the data
is stored... and that's pretty straightforward.

If anyone has some sample data, e-mail it to me, either in a flat-file, or
.csv, or Excel, and I toss up a demo web site so you can see what this all
would look like.

> 1) I don't think we need 100 2M hubs, if some of the hubs are
> connected to the internet. What I was originally thinking was
> that each hub would automatically report information to the
> database.

This is a fine idea, but we are talking about two different (yet
related) things. We still need 100 (or more, frankly) 2-meter hubs for
the purpose of blanketing the North American continent with signal
sources. The more there are, the better the BEACONet system works
because we will be able to observe band openings with a higher degree of
resolution, with more HUB's active.

When it comes to gathering all of the data to a central location, there
are two functions that come to mind: DATArchive (historical archive for
later analysis) and LIVExchange (multiple BEACONet stations attach to a
web based system, automatically feeding their heard data...and the
web-system displaying it on a web-map for others to view, too).

It's even possible for one server to perform both functions (though I
would suggest that the responsibility be split -- I don't know
why...it's just a 'gut feel').

I'll bet that UI-View's ability to feed data into the APRS(tm) APRServe
system could be exploited to create an easy-to-make link to the
LIVExchange system that is described in this note (the functions are
similar, after all).

DATArchive:
* Allow both a "batch" upload of UI-View log files
* Attach to LIVExchange system to receive a data feed from
  connected "live" active BEACONet stations
  - This would encourage BEACONet-ers to connect to the
    LIVExchange system (a good thing) to provide a common
    entry point for Internet-base data gathering.
* Somehow, add a tag to each uploaded reception report that
  identifies the receiving station, too (it does no good to
  know that G0PHO was received on a given date/time/band if
  we don't know the station that received them and it's location.
* An ability to break out reception reports by band (hence, the
  To-Call "BS" field. (be nice <g>).
* It would be cool to include a web-based playback engine, too.
  After selecting the parameters to study, have the system
  bring up a map and actually play-back the data for study.
* It would also be nice to be able to mine the data to a file
  that a researcher could download and manipulate on their own.

LIVExchange:
* Run a BEACONet station that is also connected to the Internet.

```
  Pipe anything heard on RF to the Internet (with two exceptions
  which I could comment on if necessary) LIVExchange system.
* LIVExchange would display everything heard, complete with a
  path analysis (maybe as simple as connecting icons back to the
  station that reported the reception by simply drawing lines)
  on a map on a web page!
* This is also good, because it would allow people to have
  a web site to hit to stay in touch with conditions when
  they are not near their stations!
* This would encourage the use of the BEACONet system by
  schools, universities and as a "display-only entry point" for
  non-licensed interested parties!
* The system should provide a feeder-port to send any uploaded
  data streams to the DATArchive system (see above).
* I don't see the LIVExchange system as needing to feed anything
  back to RF at this time.  I see this as a system to which data
  is fed-only.

This is a very exciting prospect.  Great thread, guys!

Rendered body type: text/plain
```

```
FYI...I attempted to generate some activity on the BEACONet frequency of
28.128 MHz within the 10-10 International community.  Here's a snippet
from an eMail that I just receiced from KC5DUI in Arkansas. . .

"Had the system on over night (forgot to set the DAYTIME so no
timestamp) and appear to have one hit from G0PHO but that's all that
shows when I run MHEARD (no grid or other info).  Right now (17 Feb
1730Z) I'm listening to 28.128 USB..."

'Just thought I'd share some successes!  Power-up for the weekend, if
you can.  It would be nice to see a couple of dozen icons by Monday.

Ev, W2EV

UI-View 28-MHz "Quick Start" instructions:

Launch UI-View and . . .
... remove lat/lon information
... Unproto Address = HY-##
      where, H=HF, Y=28 MHz and ##= antenna directivity using
      the clock-face as your guide.  3=East, 9=West, 15=omni
... Beacon Comment = [GR##ID] email@host.com
      where [GR##ID] is your 6-character Maidenhead Grid locator
      (be sure to put it between brackets as shown), followed by
      an eMail address to make QSLing easy
... Beacon Interval Fixed = 5
... Tune to 28.128 MHz USB and you are 1200 baud BEACONet active!
For more information, visit http://go.to/BEACONet

Watch for W2EV>HY-15:[FN03XD] on 28.128 USB!

A note from G0DJA:
> I've listened to the signals by ear, and sometimes I get the
> impression that the signals are overdeviated, especially on the USB
> frequency, or seem slightly off frequency.

Dave,
Help us to troubleshoot this a bit, would you? It would be helpful if you could spend some time on 28.128 (the USB frequency that you mention) and make a note of the callsigns of the stations that you can decode. If you would forward that to me, I will float that list to the BEACONet remailer (on TAPR) as a heads-up to others (not listed) to try backing off on the microphone level a tad.

Of course, this is a suggestion for a possible resolution...if anyone else can suggest another way to test for overdriven signals, please do so.

Regards,
Ev, W2EV

I'm finalizing a new look/feel to the BEACONet website and could use a set of eyes to look things over a bit before going "live". Feedback would be appreciated. Please let me know if you are available to offer constructive feedback and I'll forward the direct URL (eventually, it will be where you'll land when using the http://go.to... address).

Hi Ev,

In my Day Job I'm Manager of Web Services for Pfizer Global R & D, Ann Arbor Laboratories, and I do quite a bit of this type of thing (called an Information Architecture Review). If you like, I'll take a look at it using our review procedure, and provide you with a report. All the feedback from the IA Review takes the form of suggestions or considerations, so you can take or leave any of it.

To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-136400-2001.02.20-17.34.09--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi Folks,

I'm running UI-View 2.32, and would like to have either

1) One copy of UI-View running, controlling both my 10m and 2m BeacoNet TNC/radio setups, or
2) Two copies of UI-View running, each controlling one TNC/radio setup

I don't care which, as long as I can have UI-View active and controlling the 2m and 10m configurations.

I have installed UI-View in two separate directories, and have set up each copy to control its own band setup (2m is on COM3 and 10m is on COM1). Each can run and control a station separately, I just can't seem to get them to run simultaneously.

I've downloaded AWGPE, but frankly, I'm not quite sure what order to run, install, or how to configure the UI-View instances and the Packet Engine, and I can't find much documentation (that I seem to be able to understand) that describes how to do it.

Can someone help?

Rich

Does anyone know the purpose of the ionospheric heating signal on 3390
KHz? It is very broad, data burst every 20 seconds or so. If indeed it
is located near Fairbanks, Alaska it truly is remarkable as it continues
to be 40 db over nine in Central California at 10:30 AM Pacific Time!
     Usually the experimenters ask the hams for reports, but I've not seen
any mention this time around. Supposedly this is a 300 megawatt signal!

Not heard here in SC on 3390 USB from 19:43Z until 20:50Z (2:43 - 3:50 PM
EST). There is only some bubbly waterfall noise, at a very low level.

>Can someone help?

      OK, rich -- here's what you do.

      First, install AGWPE. Next, start the program, and it will ask you
if you want to set up TNC's. Say yes, and you'll get a window to do just
that. The confusing part is remembering whether 2 meters is on port 1 or
port 2, and Comm 1 or Comm2 or Comm 3...
      Once you get ONE TNC configured, open UI-View. It'll probably tell
you that it can't access the COMM port, as AGWPE will have grabbed
it. Just close that box and go into SETUP, then COMMS Setup and change
HOST MODE from "NONE" to AGWPE.

      That's all. You should now have UI-View running ONE TNC. Once
you're satisfied that it's working, exit UI-View and right-click on the
AGWPE icon in the systray. Go to PROPERTIES and click on "ADD NEW
PORT". Set it up for the TNC that you left undone the first time. Now,
when you open UI-View, it should access both TNC's.

      I THINK I covered it all. It's really pretty simple once you've done
it a few times, but the first time or two is pretty confusing.

      7 3

79. [propnet] 10m and 2m, I think I worked it out

From: "Rich Weinkauf" <RWeinkauf@msn.com>
Date: Tue, 20 Feb 2001 19:03:52 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-136408-2001.02.20-18.18.51--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I think I have this simultaneous 10m and 2m UI-View thing worked out (just minutes after sending off that last message), so maybe someone can confirm I'm doing it right...

I configured AGWPE to recognize my KAM+ 1200 baud port (10m setup) as Port 1, and my KPC-3+ (2m setup) as Port 3.

Then, in UI-View:

 SETUP | COMMS | Host Mode was set to AGW
SETUP | STATION INFO | Unproto Port was set to "1,3"

This seems to send beacons out on both 10 and 2m.

Is this right? (can't verify that traffic coming in will work since I don't have any regular locals on 2m (except for K8RAY, Hi Ray!), and I haven't heard a thing on 28.128 USB in the last three days.

That sounds ok. You've finished up with ports 1 and 3 because the KAM's
second port is port 2.

If you have set the TNC params correctly in the AGWPE port set-up - TNC
type, serial port baid rate, etc - it should work.

      Exactly, except I use ports 1 and 2 here for 2 meters and six meters.

      7 3
      Earl

BTW -- I've been off the air after a TNC failure about 10 days or 2 weeks
ago. Just got another TNC today, hope to get on the air later tonight, or
perhaps tomorrow. 144.39 and 53.530

82. [propnet] 28.128 MHz: Check your Mic-gain settings!

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Wed, 21 Feb 2001 07:10:13 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-136543-2001.02.21-06.25.58--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Based on a recent report from G0PHO, I am lead to believe that there may
be some folks who may be participating on the 28.128 MHz BEACONet
frequency, that may be overdriving their TNC's. Please take a moment to
do some quick "soul searching" on the following topic:

"Do I decode a lot of other stations (get icons on my UI-View screen),
but don't get many people who send me eMail saying that they've heard
me?"

I have a feeling that we may have several participants in this
category. I've gone through all of the screen-shots that people have
sent me, compiling a list of the stations that *have* been heard and
decoded, somewhere.

If you *don't* see your callsign (but have been participating), you
may want to take a moment to run a quick "check" of your system...
otherwise, try lowering your mic-gain a bit and *keep* participating on
28.128 USB. A "clean" 50-watt signal is better than a "dirty" 100-watt
signal, every day. :o)

Callsigns that I know *have* been reported as being received to date are
listed below.

North America:
VE7KNL, KJ4X, N0ELS, W2EV, WD4RBX, N1NCO, KC5NFU, WB4OOV, K1DOW

Europe:
CT2HMN, IK2CHZ, G0PHO, LA8UU, OH4MM

If you get AGWPE working, then you can have two ports running from one
copy of UI-View.

If you've got two TNCs that support KISS mode, then it's very easy to
set up AGWPE - literally a two minute job - and there's a help file
supplied with it. There are just a few common problems that can catch
you out -

1. To access the AGWPE set-up, you run the program and right-click the
icon.

2. Make sure you select the correct TNC type and serial port baud rate
in the AGWPE port set-up.

3. Don't try and use a TNC with the serial port baud rate set to 1200,
it won't go into KISS mode reliably. If your TNC is configured for 1200,
change it to a higher speed.

4. Use cables that connect the handshaking lines i.e. normal straight-
through cables.

5. If you use a KPC-3 TNC (not plus), then in the AGWPE port set-up you
should change the "InitKiss" commands to "INT KISS" and "RESET".

6. AGWPE has to be running before you start UI-View.

If you don't want to use AGWPE, then you need to install two copies of
UI-View, edit the command line of the two UI-View program icons, and add
"/MULTI". E.g. the command line will be something like -
C:\UI-VIEW\UIVIEW.EXE
so you change it to -
C:\UI-VIEW\UIVIEW.EXE /MULTI

Rendered body type: text/plain

Thanks to you guys for giving me the info I needed to get this two-port
thing going.

Just one more question: Is it possible to assign a different UNPROTO
address to each port?

I have, for now, set my UNPROTO to "BEACON", and have included the
Band/Antenna/Power designators in the beacon text:

BEACON> [EN82HL] HY1F03-15/VK1H23-2 N8QLT@arrl.net

It looks like UI-View sends the same beacon out on both bands, so I could
figure out how to set a different UNPROTO and assign one to each port. Am I
off base here?

Rich

Open the Station Setup dialogue, press F1 to display the help, and the
paragraphs below "Unproto address" tell you how to do it.

89. [propnet] BeacoNet Operating February 23, 2001 from [EM29DA]

From: kc0iuy <kc0iuy@arrl.net>
Date: Wed, 21 Feb 2001 21:16:24 -0600
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-136742-2001.02.21-21.39.26--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello all,

My friend Craig (KC0IUW) and I are planning to operate our new BeacoNet set
up on 2 meters (147.585 MHz) Friday evening, February 23, 2001 from Topeka,
Kansas [EM29DA]. (We might also operate Saturday evening.) We'll try the
10 minute normal mode and also the Meteor mode since there are several
minor meteor showers happening simultaneously this time of the year. (See
http://comets.amsmeteors.org/ and click on Calendar.)

We have a 9dB gain, omnidirectional antenna and 50 watts power. We'll be
running UI-View.

Are there any other BeacoNetters near the area? This would include the
eastern half of Kansas, the western half of Missouri, the southeastern
quarter of Nebraska, and the southwestern quarter of Iowa.

Tuesday, February 20, 2 meter propagation was very good from western
Missouri. We had repeater overlap on 146.67 MHz and a loud and clear
individual from Independence, MO (northeast of Kansas City). I wish we had
the propagation net running at the time to see just how good conditions
really were.

If you have any suggestions for us, we'd be grateful to read them.

May your SWR always be low and your signal be strong!

Rendered body type: text/plain

Hi Rex,
Welcome aboard! It's good to know that more folks come on-board even
during the "off months" in late winter and early spring.

Activity for meteor showers centers around the major showers at this
time. The reason is that the BEACONet project is still in the process
of evangelizing to get a critical mass of "Meteor Class" stations (those
with enough ERP to have a favorable chance of being heard). Any ERP
that is less than 400-watts on 2-meters stands a very low (but not
impossible) chance for being heard by others. For more information on
BEACONet and our burst mode "scheduling", take a look at Rich Parry's
BEACONet METEORegistry web site at: http://go.to/METEORegistry.

Of course, another factor is the number of rocks that fall... if more of
them are available, the chance that a few of them are larger (greater
ionization) is greater, too. This affords even the smaller stations
with a larger chance of success. Again...a reason why we ramp up only
for the major events at this time.

While I have no desire to discourage you from participating, would you
consider joining us on 28.128 MHz USB between now and the next major
meteor event? That's where a bunch of us are playing.

Then again, maybe your eMail will encourage a few others to attempt MS
with you even during this time of the year. Don't forget that, with
BEACONet, success is not in the receiving of icons -- but in learning
why they were either received or not -- and bettering our chances on the
next attempt. :o)

Also a quick note...as we approach spring-time...more of us will return
to 24/7 population of 147.585 as we use the BEACONet system to study
tropospheric inversions/ducts/etc. Stick with us!

BEACONet is a lot like fishing...you never know when the "big one" will
get caught by the system...but you can go days without a nibble. :o)

Again...welcome aboard!

Warmly,
Ev Tupis, W2EV

Lesson learned.

I got off from work at 6:00 PM and when I got home I fired up the old laptop
(DOS) to check the TNC MH list and saw that the New England states were
coming in and in my haste to switch over to my Windows machine I knocked the
power plug out of my TNC so I lost my MH list and I am not sure if I received
a packet from N0ELS. I do remember seeing Ev's call and an 8 call.
Interesting information lost. Starting next month I plan to leave my desk top
machine running with the monitor off (energy efficient) and log file running.
OH Ya I don, t think that I have mentioned this before but I have been on
28.128 for over a month 24/7 and before this I received only one packet from
Ev's beacon. I really think that we are missing some propagation
opportunities on 10 Meters.

Thanks for the cool report.

I heard G0PHO here near Boston for the last time at 17:14 UTC today on
28.120 ssb packet.
Call here is N1NCO Grid Squ. fn42gl - 5378 Km between here and G0PHO.

I'm trying something new here. In previous experiments, I've been using my
KAM Plus TNC.

Now I'm using the agwpe software packet engine and my sound card as the
TNC. With UI-View32 on top of that as usual.

It all seemed to install and setup OK (thanks to KC2RLM's very good
instructions on how to do it - see www.qsl.net/soundcardpacket) and appears
to be working at least on RX.

I have had the KAM Plus connected to the radio rx output at the same time
and note that the KAM Plus did not see G0PHO (checked using the MHEARD and
a terminal emulator). This indicates that the agwpe packet engine, may be
more sensitive to the kind of thing we are trying to do. Anyone else had
any similar experience or comments?

If agwpe works well for this, it means anyone who want's to participate
does not have to find themselves a TNC first. That may help get more hams
interested. It's also possible it may be better than the average TNC, but
more testing is needed to prove that.

I'm driving my rig from the sound card output and seem to be putting about
70 watts to the antenna whenever UI View beacons. I'd be interested to know

if any one has heard me today.

After several weeks of being off the air due to a TNC failure, Ben
Pollard, WS5R, has given me an AEA PK-12 to replace it. Therefore, I'm
back on 144.39 as usual, and 53.530 FM, 1200 BPS, 24/7.

      7 3

Good going Earl (and thanks, Ben!). Just in time for the summer Es
season. This year, I'm pointing 53.53 right at 'ya Earl. :o)

4-elements and 100 watts. But not for another month...it's real
slippery on the ol' roof at this time of year for me. :o))

It could be digipeating on any number of aliases, Earl. Which one is
the HUD reacting to? Once you identify that, we can turn it off.

The aliases that come to mind are the following:
MYCALL
MYALIAS %
MYNODE %
UIDIGI %
UIFLOOD <- I can't remember the "off syntax" off the top of my head
UITRACE OFF, NONE

Hope this helps.
Ev, W2EV

      This particular TNC is a KPC-3 (not "Plus"), and had an alias of
"RELAY" in it. "HAD" is the operative word -- I changed it to "CAR" and it
quit. Too bad I couldn't turn it off, though.

      Thanks,
      Earl

Rendered body type: text/plain

OK, folks...I need some advice (not that I will necessarily take any of
it once it's offered, or anything <grin>).

When it comes to using "Imperial" versus "Metric" units of measure, how
would you prefer to deal with HAAT? A unit of measure being Feet or
Meters?

As you know, HAAT is one of the parameters that is embedded in our
To-Field. Stan Horzepa (WA1LOU) just floated this to another listserve:
- - - - - - - - - - - - - - - - - - - -
It is an FCC on-line HAAT calculator at
http://www.fcc.gov/mmb/asd/bickel/haat.html
- - - - - - - - - - - - - - - - - - - -

If you go there, you will need your latitude/longitude and your antenna
height above mean sea level in *meters* to do the calculations. My
question is driven by future software writers who may wish to
incorporate the information that is contained in BEACONet transmissions
to do some type of "range calculation" or something.

Would we be better off embracing metric now as part of the to-field
protocol, or does it matter?

Opinions?

Ev, W2EV

My vote is for meters. Keep us international, plus, meters is part of the
same system of units as the rest of amateur radio. Dave, KV4CN

      Hmm -- "embracing metric". I keep hearing that phrase, and in school
I was taught that most of the rest of the world uses the metric
system. However, over the past few years I've been hearing otherwise.

      Anybody in the UK -- what system do you use there? Do you use both,
one or the other exclusively, or do you use a combination?

      Thanks,
      Earl

I use a mixture of both metric and imperial, with a few exceptions. I
can't picture a kilometer so speed for me is all in miles per hour and
(large) distance is in miles, which is fine as our roadsigns are all in
miles and miles per hour. Temperature for me is only in degrees C, but in
my experience older folk tend to prefer degrees F. Inches and
millimeters, no problem as I can think in both.

One slight moan I have about "your side of the pond" is that your
(plentiful and interesting) documentaries all seem to refer to kilometers
and kilometers per hour, so when they're on about how fast for example an
F15 is or what range it has I haven't a clue what it means in "proper"
units. :)

Cheers,

Mark.

I'm 5' 9" tall, I weigh 11st 7lb, and the temperature here today peaked
at 40F... I think the majority of people in the UK would probably still
instinctively use imperial units.

But we are now officially metric, and, in a technical context, I would
use metric units. The rest of Europe certainly uses metric units.

It's really a shame that there is a dirth of equipment for 6-meter FM,
yet, interest continues to grow. I received this note from Bruce
(KD5IUG) recently. He will be joining us on 6-meters (and the remailer)
soon. I've included snippets from his eMail as an fyi.

So Earl...it looks like there's some hope for having a station within
1-hop range from you! Keep the faith...this stuff works! :o)

Ev, W2EV

Subject: Re: Beaconet
Date: Sun, 25 Feb 2001 21:45:08 -0600
From: Bruce Brackin <bbrackin@bellsouth.net>

Ev - Thanks for the note - understand the email routine! As fate would
have it, I just landed a MFJ1270 for 40 bucks so that answers that I
guess! Have downloaded the UI-view too. Neat package. For
interfacing ease, I think I'll start with my old but very good Standard
5900 tribander Have a 100 watt TPL "brick" I can use. My Elmer has a
6m Ringo I need to pickup next time I am down his way as well. Quite
seriously considering hanging it by top from between a couple of 90'
foot pines in back yard (with plenty of slack of course). Also running
out of roof! With the tri-bander I can also easily switch between 6m
and 2m to boot. (have 70 watt Motorola amp for 2m).

With a little luck and learning the TNC and term program a bite, I hope
to be up and running to some extent within 2-3 weeks. I have "looked
around" the shareware on QRZ and downloaded several terminal programs to
try out. - open to suggestions by the way. I'll also sign-up for the
listserver.

Bruce, KD5IUG

1 vote here for meters of antenna height.
If we ever try to publish our information in a 'serious journal', we'd better be using metric.

Am using AGWPE (SoundCard settings) and UI-View to run my TS450S at about 50 watts to a dipole up all of
 15 feet. Started 28 Feb at 2350Z and should be every ten minutes for the next 24-48 hours - depending
on our wx. Signal appears ok when monitored on another receiver using an MFJ 1276 TNC.

IF anyone hears my signal would appreciate an email (don't want to overdrive the system). All I've been
 able to get to print was G0PHO ONE time about 10 days ago. Hopefully, propagation will work out.

Thanks and 73,

Bob - KC5DUI - Springdale, AR

Hi Bob

Hang in there your day in the sun will come. I am running 25 watts an Antron 99 at 40 feet with good results. I have been running 24/7 for 6 weeks today and have received 4 US stations one Canadian and 6 European. There has been some cool propagation that allowed W2EV and N0ELS to receive my signal at the same time. Also I have received just one packet from W2EV about a week before that.

I will be off from work for 5 days starting Friday morning. If I see that the band is open to AR (starting today) I will switch to my 6 elemant beam and point it at you.

Have a great day
Rich
WD4RBX EM84NM

> Is anyone using a Radio Shack HTX-10 for BEACONet on 28.128 USB? If
> so...have you had any successful reports of people hearing you?

Yes, I'm using an HTX-10 to a 10m vertical, and have yet to either hear or
be heard on 28.128. I've monitored my signal (which I can hear out to about
8 miles), and it sounds right. I've been running with this setup for a
little over two weeks now.

I know it receives and the TNC will decode because I parked on 28.182 USB
for a day or so and picked up N7OO running TheNet in Arizona. I have tried
parking on 28.189 LSB to see if I can pick up the APRS feed out of Maryland
and California, but nothing heard.

I'd like it if I had some confirmation that it's working on BeacoNet, but
then, I've been running 24/7 on 147.585 with 180watts to a4-el beam since
early November, and haven't heard any DX. I'll just have to be patient.

Nothing heard here, yet, Mark. I'm looking for you from FN03xd. Not to worry, though...we haven't really hit tropo season yet. Stick with it...BEACONet is a lot like fishing...you can go a long time without a nibble, then the "big one" hits. :o) At least until we get to a point where the continent is blanketed with BEACONet-ers every couple of hundred miles or so.

Hi Rich

I am not sure where you are located but I can tell you that the band has been flat (do to low participation). I am using a RCI-2950 24/7 for just over 6 weeks and have received 12 stations and have been decoded by many of them. As of 2/25 to date only 1 G4IDE. In my opinion (for what ever it is worth) figuring out why makes us BECOneter's cutting edge pioneers.

8. [propnet] HTX-10 on Packet

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Fri, 02 Mar 2001 21:17:50 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-138411-2001.03.02-20.33.30--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I received this note from Buck Rogers (K4ABT):

"I am using the HTX-10 on 10 meter Packet. As a matter if interest, I use the PSK31 RASCAL interface and the AGW sound card Packet driver and experience no problem on Packet mode or PSK31 using the HTX-10."

This would suggest that the problem that Tony is having is local to the particular transceiver he is using, rather than a systemic issue with all HTX-10's...or maybe a problem with the TNC itself?

Anyway...fwiw.

Rendered body type: text/plain

Hello Everyone,

Since the beacon freqs were explicitly chosen to not interfere with weak
signal portions of the bands, would it be worth while to write a sidebar
article for QST's announcement of the June VHF Contest? Perhaps BEACONet
would get some exposure, participation, and we would be able to see some
packets fly back in forth that weekend. Thoughts?

Thanks,
-Chris, AA1VL

> Has anyone heard my 40 watt beacon on 147.585 MHz?
> We're in [EN90rg], Brooke County, WV

Well Mark, I'm running 180 watts to a 4-el beam on 147.585, and it's pointed
at 4 o'clock- right at you. We'll see what happens over the next couple
months.

And, for anyone else wishing to run an HTX-10 on 10m, you can find the mic

pinouts to build your cable on K4ABT's web site:

http://www.packetradio.com/sb16rads/ISOKITS/htx10.gif

Other helpful information for other radios is also there at:

http://www.packetradio.com/psk31.htm

And you can find the 6-pin female mic plugs at Universal Radio, #1919, $3.19
ea:

http://www.universal-radio.com/catalog/parts/micplug.html

In case you haven't noticed, the web site has gone through a redesign.
I'd really like to hear some feedback as to ease of use, and if you
can't seem to find something that you used to rely on under the old web
site.

I'll use your feedback as a sounding board prior to making global
announcements to the general amateur community. First and foremost, it
is designed to draw newcomers to BEACONet. The "Turbo Links" section at
the top is designed for the rest of us. :o)

Comments direct, please.

Ev, the new webpage looks good. I especially needed the
information contained in the paragraphs: If you are already
configured for APRS. My problem is and always has been that I
want to use a PK232 for the TNC. With this burden, one must
know what packet configuration to assemble! One problem
remains. The older PK232 made in kit form by HEATHKIT uses
the old SEVEN bit ASCII code rather than 8,N,1 used nowdays.
I do not know if this will work in the BEACONet system. Just
think of how many of these older units could be pressed into
service rather than being tossed out! Possibly Bob Bruninga
might know if the seven bit code is usefaul in either service.

14. [propnet] Web Development Needed

From: "Ev Tupis (W2EV)" <w2ev@rochester.rr.com>
Date: Sun, 04 Mar 2001 16:57:36 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>

Rendered body type: text/plain

Hi Folks,
The BEACONet project is in need of some web development work.
Specifically, it would be helpful if someone would develop a web-based
form that would ask for station parameters (Frequency, Network
Personality, Power Output, Antenna Gain/Element Count, Antenna HAAT and
Antenna Directivity) and calculate the correct value to place in the
"To-Field".

This is all the stuff that appears in the BEACONet protocol (on the new
web site under: Information | Full BEACONet Protocol). I can help by
providing input on layout and manner of asking for the information.

Is there anyone willing/able to provide this service to our community?

Ev, W2EV

Hello the group,
I (KC0IUW) with the help of Rex (KC0IUY) have just finished setting up the new computer in the ham room. I will be running 50 watts into a GP-9 vertical up 35 feet on a pretty regular basis now. My HAAT only works out to about 6 six feet but am going to give it the old college try. I will have the system on whenever the propogation looks like it might be even halfway reasonable, as long as there is no chance for thunderstorms. If any one in the central part of the US is going to be going on I would appreciate hearing about so we can try and coordinate schedules. If things start to pick up I can leave it on 24/7 as long as the equipment holds out! Looking forward to the first contact.

What band? I run 53.530 24/7, and 144.39 24/7, unless there's a meteor shower in progress, when I switch to 147.585.

Hello folks,

On 03 MAR @ 12:35 EST my station picked up a garbled message from an MK0 station directed to Ev, W2EV. I had PASSALL OFF, so this message has no real information in it, other than the beginning of a callsign, and Ev's as the Destination Call.

Cool, this is the first time I've picked up anything from my 10 meter setup.

Hi Rich

I am hardly waiting for BECOnet to take off on 10 meters. I am not an expert
on propagation phenomenon but I believe that ounce we have a boat load of
participants on 10M we will see lots of really interesting stuff happening.
In fact my belief is that it will happen on ten before it shows up on 6M.

I agree! The potential for world-wide success is much greater on
10-meters than on any other band for a number of reasons...including the
availability of equipment that can be dedicated to use as Hub-class
stations.

There are a lot of 25-watt transceivers out there. That, together with
a world-wide allocation at 28.128 make the 10-meter BEACONet a
"slam-dunk" for success...it's just a matter of evangelizing.

Hmmm...I wonder if QST is going to be printing anything about us, any
time soon? ;-)

Also...one *big* experiment will include some meteor mode stuff. It
will be interesting to find out if 10-meters has much success on this
mode (or as much success as 2-meters does).

There's so much to learn...and we've got a front row seat at the show!

Rendered body type: text/plain

For some reason, propagation on 10-meters has suffered a bit, but please
don't let that get in your way of powering-up while you are at work!

Don't let those transceivers "go to waste" while you're slaving away for
"the man". :o) Join-in on the fun...come home and see what you caught!

Ok...I'm almost out of exclamation points, so don't make me use 'em all
up on this note. :o)

The beauty of BEACONet is that it can run automatically. Visit the new
BEACONet website and follow the instructions for setting up a station.
Stop lurking, and start participating. If you need help, then just ask.
  There are plenty of folks on this listserve willing to lend a hand.

Ev, W2EV

Hi Ev and all

Ev, You are my Packet (BEACOnet & webmaster ;-)) mentor so let me apologies
before hand.

Ten meters has been killer here in the South east. I have heard recently
JA's,VK,ZL, HK,AH, and a pile of countries not to mention stations west of
the Missippi.I am not talking about weak signal stations. I have to admit
that the ten meter band has ben flat twards Europe. What 10 Meter BECOnet net
needs is Participation !!!!!!. While you are chatting on ten tell your
contact about BEACOnet. I DO! While I am chatting on ten my BEACOnet beacon
is running.

Anybody want to try this let me know. I really think that I have received one
of Ev's packet via meteor saturation.

I can run 100 watts to a 6 element beam. I can also run 1200 watts if it is
possible to use the PTT line from a TNC to key a Cliperton-L

Someone recently suggested that a sidebar be written to include BEACONet functionality in Rovers. (sorry, I seem to have lost the eMail)

I purposefully let it go at first, but decided to to an "about face" because I feel very strongly that this is a prime service that BEACONet can provide.

As the original writer noted, BEACONet frequencies were purposly chosen to be as far from the SSB/CW sub band as possible, so as to allow for concurrent operation.

There are camps on both sides (SSB and Packet) that come up with all sorts of reasons why this "will never work". SSBers still think of anything that has "packet" associated with it as digipeated, connected traffic (like the BBS's of old). They don't take the time to understand what UI-Frame packet is capable of (both in performance, and the ability to operate in simplex mode).

It will take a couple of VHF Clubs to exploit the BEACONet advantage (using unconnected, non-digipeated transmissions) before the ARRL contest desk will take notice of it's use and take the time to understand that it can be used within the spirit and letter of the rules.

By the way...I am already planning on operating the ARRL 10-GHz and above Cumulative contest with BEACONet in full-operation. What a tool! :o)

Ev, W2EV
10-GHz WBFM @ 100 mW
10-GHz SSB/CW @ 200mW
24-GHz WBFM @ 20 mW
47-GHz SSB/CW @ 0.5mW

....
.. but I believe that once we have a boat load of
participants on 10M we will see lots of really interesting stuff happening.
In fact my belief is that it will happen on ten before it shows up on 6M.

Well, that boat load needs to learn Morse code to participate. Thats why i have been on 6 and 2m only,
with plans for 220.

Respectively submitted,

Wm Seffens

Of course! This is how we get there:
1. Participate
2. Open a log file to capture what you get
(the datafile is now contained on your local computer in the "Logs"
folder)

A while ago I suggested that what we need is a website that could accept
log files and parse them into a format that could be researched. A
couple of folks stepped forward to suggest that they'd be willing to do
just that (though I've not heard much about it lately). See
http://go.to/BEACONet under the hyperlink "Introduction" and the
hyperlink "The Lingo" for information on this system that I call
DATArchive.

Of course, before we can get meaningful data, we need meaningful
participation. :o) Power-up folks! Item #2 is meaningless unless we
have more folks doing Item #1. The system works! Join-in on the fun!

Don't forget...BEACONet is a bit of a Swiss Army knife. :o) It caters
to a lot of diverse interests. I doubt anyone will challenge the fact
that 10-meters is better suited to study f2/Es type propagation
variations. Yet, 2-meters is well positioned for further meteor
studies. 6-meters is in a relm "between" the two, with characteristics
of both. 223.780 MHz is truly an experimenters dream as it poses quite
a challenge (both in available equipment as well as propagation modes).

We're about to embark in wholy new areas, too...VHF Contest support of
Rover category stations comes to mind.

I've also recently learned that the AGWPE software appears to allow
TCP/IP connectivity between other AGWPE stations...potentially allowing
for us to begin exploring the ability to link BEACONet stations in a
peer-to-peer like Internet based network! (no details here yet...I'm
still learning...but don't let that stop you from exploring this on your
own!)

There's a little bit of everything out there, folks. BEACONet is a
community of experimenters. Join-in on the fun!

Assuming you get it into a file, what are your thoughts about getting from
the local computer to the db. We discussed this before and see a way of
doing it from a web interface.

Good Morning, Bryan,

> However, a bigger question is how we get the logs
> *out* of UI-view.

I agree...generating the log files is easy (and they come time/date stamped already--at least as accurately as the local computer's clock is). Our meteor mode experiments have shown that we can easily stay within 7 1/2 seconds of each other for days at a time using modern computer equipment.

Since LOG files are simply text, wouldn't periodic batch uploads by individual BEACONet-ers make a lot of sense to start with? Especially given that most folks probably still have dial-up Internet access and can't tie-up a phone line for long periods of time to stay connected in real-time?

Is "batch" simply a periodic ftp? It seems that easy, but I don't know the ramifications/issues of doing so.

In my non-programmer mind's-eye I know that if I click here: mailto:w2ev@rochester.rr.com my browser will automatically launch your eMail client to send me an eMail. There are additional parameters that would allow me to automatically enter a Subject and even some message text. Is there a similar way to "press a button" on a web-site and have the site prompt you for the text-file's location on the local machine, and then simply "go get it"? I don't know...these are just the ramblings of a user. :o)

Of course, I'd want to pilot it to make sure there are enough data validity-checks (such a system could potentially allow anyone to upload anything, I suppose).

Let's figure out a way to get a lot of different text files into a central database (even a flat file to get us started) first. We can figure out how to re-parse it for meaningful analysis a bit later, if need be.

Excellent conversation on this thread! Please...I hope that no one reads any disparaging meaning into anything above. None was intended. This is a good example of the collaboration on which BEACONet was based!

Regards,
Ev, W2EV

39. [propnet] from file to database

From: Colleen LaPlante <colleenlaplante@mn.mediaone.net>
Date: Wed, 7 Mar 2001 21:04:38 -0600
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-139392-2001.03.07-21.20.01--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Richard,
It seems that there are two ways to get the file into my/a database:

1) a web page that people go to that allows them to 'upload' the file.
 [Actually I have some software that does 98% of this, but it needs a more
powerful server than I posess.
2) e-mail it to me, or to a special e-mail address. Either I manually run
the job that loads the data into the database, or perhaps some automatic
script could be written.

At this point I'm not much worried as there doesn't seem to be a way to get
a file made in the first place.

Bryan,
You mentioned:
> At this point I'm not much worried as there doesn't seem to
> be a way to get a file made in the first place.

I'm not sure I understand. Do you mean a local log file to upload to
the system or something else? (a local log file is easy as there is a
"logs" drop-down menu in UI-View).

Clarify a bit?

Hi Craig!
I'm really looking forward to the spring thaws and associated
inversions. :o)

As for the RS 10m rig...here's what I know:
1. It works using a sound card, AGWPE & UI-View, because "Buck"
   Rogers' web site lists cables for interfacing it.
2. I've ordered one (used) myself, and will be posting directions on
   interfacing it with a TNC (for Level-I Hub-operation) by the first
   day that I have it.

This seems like an excellent rig for remote, unattended Hub use.

Now...though...you've got my interst piqued. Why did RigBlaster say
that they couldn't get it to work with their product?

Rendered body type: text/plain

BEACONet is a bit of a Swiss Army knife for propagation enthusiasts.
While much has been written lately about tests we've been running on
10-meters, many of us first got interested by "shooting meteors". After
all, not all of us can be active 24/7 and several days of intense
activity can be fun, too!

The next appreciable meteor event that is on the proverbial horizon is
the eta-Aquarids. Stats below:
Overall Time Peak Rate km/hr
Apr 19-May 28 May 05 66 60

The Rate tells us how many rocks we typically see in an hour near the
peak. The km/hr is the speed at which they enter our atmosphere.

This event is significant because it has a potential of 1-rock per
minute (many opportunities for catching one that is "just right") and
they enter at a pretty good speed (ionize higher in the atmosphere and
with more density -- greater DX and higher propagated frequency).

It is this very characteristic that makes the November Leonids as
successful as they have proven to be for us (ZHR=120 and km/hr=76). If
you've been discouraged because of all of the talk about 10-meters, be
so no more!

Start thinking about ramping up for the eta-Aquarids and let's see what
we get. I have no idea...this is the first time we'll have tried during
this event.

If you are new to BEACONet, then visit the web site
(http://go.to/BEACONet) and read about setting up for Meteor Mode.

Rendered body type: text/plain

An interesting convergence is occuring (more on this later).

Is anyone interested in experimenting with PSK31/BEACONet on 10-meters
or 6-meters?

Reply to the remailer, rather than direct. Depending on the response,
we may just play a little. :o)

Roger Barker has released a UI-View/PSK31 system that would be
advantageous for us to embrace, if we have enough people interested.

What say?

You have hit upon one of my other major Ham Radio interests - PSK31.
PSK31 seems to be a pretty effective mode on all the HF bands. I'm not sure

exactly what you propose, but it sounds interesting.
Count me in!

Ed - Would be interested in the 6m PSK - The old Swan 250 is a bit
unstable for 24/7 unattended but hope for have newer and stable rig
shortly (and would need to add some COM ports!) Any proposed freqs in
mind? I know some are running PSK on FM mode on 2 and 6 meters.

Ev,

>Roger Barker has released a UI-View/PSK31 system that would be
>advantageous for us to embrace, if we have enough people interested.

I'm very impressed in PSK31's performance on the HF bands for keyboard
QSOs. It's incredible how it will pull the data from a signal that I
can't even hear in the noise. Very impressive!

>From a BeaconNet standpoint, I'm asking how PSK31 would help in the
propagation studies. How is PSK31 used with UI-View to enhance this?

When I was running PSK31, it was streamed data like RTTY, not packetized
like, well, packet. How is this applied in BeaconNet?

Also, I'm not aware of the specifics (too many other things going on...)
or PSK31. I believe it interleaves data and applies a convolutional
code, which essentially 'spreads' the transmitted data over time. Also,

it's a very slow symbol rate.

My concern would be how long it takes to transmit a burst of BeaconNet
data.

Through my lurking over the past couple of years, it seems you want to
burst the data repeatedly, in the hopes of catching a meteor event. To
me, it would see that in one would want to shorten these repeated
transmitted bursts/packets to as short as possible to enhance the
chances of them getting through the channel.

Of course, I do read that you mention on 6M, where sporadic-E band
openings are much more common and longer lived than Meteor events on 2M
or 440...

If you could add to your previous email about using PSK31, I'm sure
there's other nerds out there who would be quite interested in the
details behind PSK31 and UI-View.

Thanks,
Tim

Rendered body type: text/plain

Tim asked some excellent questions and made some thought-provoking
statements...

BEACONet is about experimentation and proof-of-concept. We "do" first,
and find an application after analyzing the results of "do-ing".

Even so...

Tim Baggett wrote:
> I'm very impressed in PSK31's performance on the HF bands for keyboard
> QSOs. It's incredible how it will pull the data from a signal that I
> can't even hear in the noise. Very impressive!

So the question is...if very narrow, very efficient PSK31 is
propagating, is there a correlation to the "less efficient" modes of
SSB/CW propagating? On the other hand, if AFSK data is propagaing, we
know that SSB/CW must be, too. Hmmm. :o)

> >From a BeaconNet standpoint, I'm asking how PSK31 would help in the
> propagation studies. How is PSK31 used with UI-View to enhance this?

On the other hand...knowing that the band is "on the verge" of opening
for traditional SSB/CW communication in a given direction may give DX
chasers and propagation nuts some interesting things to be on the
lookout for as things build.

> When I was running PSK31, it was streamed data like RTTY, not packetized
> like, well, packet. How is this applied in BeaconNet?

The idea is to build a "packet-like" string of characters and send them
using PSK31 modulation techniques. There are areas where they diverge:
PSK31 has no CSMA (collision avoidance) and no error-checking. Both of
these items can be dealt-with in many ways as BEACONet/PSK31 matures
(*if* it matures). For instance, the UI-View author may build-in a
"randomize TX" feature, wherein operators state the maximum time between
transmissions and the computer simply TX randomly within that time
frame. Maybe there is a need to include a checksum at the end of each
TX frame for error-detection. There are probably many ways to address
these issues. These are just two ways of looking at it.

> My concern would be how long it takes to transmit a burst of BeaconNet
> data.

Agreed, but don't forget that BEACONet data is very succinct:
WA0BCD>BSNPAH-#:[GR##ID] WA0BCD@ARRL.NET
-or-
wa0bcd>bsnpah-#:[gr##id] wa0bcd@arrl.net

I doubt it will be much of a problem...but there's one way that we can
find out. :o))

> Through my lurking over the past couple of years, it seems you want to
> burst the data repeatedly, in the hopes of catching a meteor event.
<snip>
> Of course, I do read that you mention on 6M, where sporadic-E band

> or 440...

The beauty of BEACONet...it has so many applications :o). I envision
BEACONet/PSK31 as being used for 24/7 Standard Mode stations (those
probing the ionosphere for Es/F2 openings and for tropo). I have no
idea if it is usable for meteor work because of the very fast doppler
involved and the ability of the receiving station to track that fast.
Another good experiment!

OK, folks...it looks like we have enough interest in giving it a try.
Stand by, I'll be floating the information about participation later
this afternoon or early this evening. I'm still trying to get my ducks
in a row with Roger over how the system operates and will post the
information to both this remailer and will add a section to the BEACONet
website (http://go.to/BEACONet).

In the mean time, get those computer sound cards interfaced to your
transceivers. :o) You can get help/diagrams/kits by visiting
http://www.packetradio.com.

Regards,
Ev, W2EV

Rendered body type: text/plain

Much better week signal performance but tuning and capturing would be hard
to automate with the software I have used. However, there maybe something
else out there now. A week signal mode that could be packetized may take
some cutting and pasting in the programming department but may result in
more hits in MS operation. Since stations that are optimized for MS
operations are rare this may allow some station that are close to be very
active participants.

This sounds like the very beginning of a good idea for migrating packetized
data into the week signal arena. With PSK31 and preprocessing to packetize
and post processing to tune, capture, error correct, and recover packets
this could get very interesting and accelerate the experiment.

Dave, N0HS

In preparation for the next meteor event, the eta-Aquarids, I have made
significant changes to the METEORegistry web page. If you want to know who
is participating in the event, this is the place to register.

http://w9if.net/cgi-bin/beaconet/main.pl

I WILL OPEN THE PAGE OFFICIALLY FOR THE NEXT EVENT SUNDAY MARCH 18. FOR THE
NEXT 7 DAYS I ASK THAT YOU TEST THE PAGE. YOU WILL BE REGISTERING FOR A
"TEST_ONLY" MS EVENT. PLAY WITH ANY AND ALL FEATURES. REGISTER AS OFTEN AS
YOU LIKE. I NEED YOUR "EYES" TO LOOK FOR ERRORS.

NEW FEATURES:
o TX Power options coincide with the new specification.
o Antenna length options coincide with the specification.
o Antenna direction has been added and coincides with specification.
o 10 meter band has been added as an option
o To correct errors, you can now register again
o Added a "Probability of Success" icon
o Web page layout significantly updated
o Added Map showing "POS", antenna direction, and antenna beamwidth

Thanks in advance for your help,
Rich Parry, W9IF

=== Ev's previous announcement follows as a reminder ====

The next appreciable meteor event that is on the proverbial horizon is the
eta-Aquarids. Stats below:
Overall Time   Peak   Rate km/hr
Apr 19-May 28   May 05 66   60

The Rate tells us how many rocks we typically see in an hour near the
peak. The km/hr is the speed at which they enter our atmosphere.

This event is significant because it has a potential of 1-rock per minute
(many opportunities for catching one that is "just right") and they enter
at a pretty good speed (ionize higher in the atmosphere and with more
density -- greater DX and higher propagated frequency).

It is this very characteristic that makes the November Leonids as
successful as they have proven to be for us (ZHR=120 and km/hr=76). If
you've been discouraged because of all of the talk about 10-meters, be so
no more!

Rich Parry

60. [propnet] Eta Aquarids & Radio Shack 10 meters Rig Blaster

From: "Craig McManus" <cmcmanu2@topeka.k12.ks.us>
Date: Mon, 12 Mar 2001 09:57:42 -0600

I would like to help with the Eta Aquarids coming up. I will be on 2 meters (possibly 10) working with 50 watts and a small beam antenna. I realize that I am probably underpowered but want to try anyway. I would appreciate guidance on antenna pointing both in azimuth and altitude for the meteors. It will be a put it up and forget it mount since I have no way to change it without climbing ladders, etc.

In regards to the Radio Shack and Rig Blaster: the radio shack has a 6 pin microphone and the rig blaster is set up for other pin configuration. I have asked how we could make them work together but have not gotten a response as of yet.

Craig,
It'll be great to have you on-board for the event! This will be the first time that we've tried for this shower, so it may be a boon or it may be a bust! We'll find out!

You're right about being a bit under powered. For 2-meters, you'll need a 10-dBd gain antenna to come up to having a 50% chance of success...but again, you never know. There were actually a couple of successes noted during the leonids where underpowered stations actually were heard. We've never tried on 10-meters, but I'd bet that 50-watts to a dipole should get some results.

As for pointing the antenna, that's the easy part...Rich Parry (W9IF) has put his programming prowess to work and has developed a "registry" page for meteor events. It's called METEORegisty (go figure). :o)

Registrants hit the site and give specifics about their operation, including: location, power and antenna. If you wait until just before the eta-Aquarids to register, you'll know where everyone else is, and can make plans accordingly. It's an excellent web site.

Rich is letting the system "shake out" until April 1st with a "test" event. Then, he'll be going live just in time for the eta-Aquarids. You can check out the site at: http://go.to/METEORegistry.

See if you can borrow a "brick" amplifier between now and "the rocks". Having the extra power will do you well. If not...that's ok! It's good to have you aboard!

Regards,
Ev, W2EV

62. [propnet] BEACONet^31 is here!

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Mon, 12 Mar 2001 19:40:39 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-140293-2001.03.12-21.58.42--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Join-up the BEACONet concept with PSK31 modulation and you have the makings of a potentially powerful propagation probing tool!

Here's how it all works together:

UI-View sits on top of PSK31srv

which sits on top of Windows95 (or above)
which sits on your Pentium100 (or above) PC
which has a 16-bit SoundCard connected to your transceiver.

You assemble the bottom three lines worth of stuff, and get the top line
(UI-View and PSK31srv) from the BEACONet website
(http://go.to/BEACONet). Help on the SoundCard to transceiver interface
is available at http://www.packetradio.com/psk31.htm

First, setup PSK31srv (read the helpfiles...there is no way to get this
system to work without reading the helpfiles). Then setup UI-View
according to the PSK31srv helpfiles (you *did* remember that it is
important to read the helpfiles, didn't you?).

Use standard BEACONet convention for your transmission:
CALL>BSNPAH-#:[GR##ID] email@host.com
-or, minimally-
CALL>CQ-#:[GR##ID]

(NOTE: see the footer to this eMail, which describes the BSNPAH-#
       encoding system. We can tell alot about propagation by
       using it. If you don't want to take the time, then use
       CQ and the -# parameter...but that is a poor substitiute.)

Tune your transceiver to 28.128 USB and see what you get. It may take a
couple of weeks for others to begin to come on-board, so be patient.
This is brand-new technology!

You may be wondering why 28.128 USB? It's the 10-meter BEACONet
frequency! (but you knew that) The BEACONet duty cycle is one
transmission every 5-minutes. There's plenty of channel-capacity to
hold both traditional BEACONet and BEACONet^31 operation on the same
frequency. If we find that to not be true, we can always QSY one of
them to another frequency. (it's about experimentation, after all!)

Ev, W2EV
http://go.to/BEACONet for more information about BEACONet^31

The BEACONet To-Field protocol spec as it applies to the Amateur
service:
BSNPAH-D
^^^^^^ ^
|||||| |
|||||| +- Antenna Directivty (Table 6)
||||||+--- Antenna Height Above Average Terrain (Table 5)
|||||+---- Antenna Gain/Element Count (Table 4)
||||+----- Power Output (not ERP) (Table 3)
|||+------ Network Personality of the station (Table 2)
||+------- Band & Sub-band (frequency of operation) (Table 1)

=== Table 1 (BSnpah-d) ===
Frequency of Origination (Band, Sub-band)
HY= H means HF, Y means 28-MHz (up to but not including 29-MHz)
VB= V means VHF, B means 50-MHz (up to but not including 60-MHz)
VK= V means VHF, K means 140-MHz (up to but not including 150-MHz)
VS= V means VHF, S means 220-MHz (up to but not including 230-MHz)
UA= U means UHF, A means 400-MHz (up to but not including 500-MHz)

=== Table 2 (bsNpah-d) ===
Network Personality
For BEACONet^31 operation, this value is 0 (zero) because no digipeating
is allowed by PSK31srv and no one is setup to BRIDGE or GATE -- yet. :o)

=== Table 3 (bsnPah-d) ===
RF Power Output
A - 1W   E - 16W   I -250W
B - 2W   F - 32W   J -500W
C - 4W   G - 64W   K - 1kW

63. [propnet] New BEACONet station reported

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Tue, 13 Mar 2001 06:46:43 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-131-2001.03.13-06.02.39--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
I got this reception report from Norm, N0ELS (it supports a previous
success report from KB6LWN).  This was using standard-mode AX.25
BEACONet on 28.128 USB:

Callsign Grid           Distance Bearing     Date  Time
 N0ELS   [EM15GH]            0.0       0   Mar 12 19:48
-KB6LWN  [CM88PS]         2270.4     287   Mar 12 19:37

Ev, W2EV
http://go.to/BEACONet

Launch UI-View and . . .
... remove lat/lon information
... Unproto Address = HY-##
      where, H=HF, Y=28 MHz and ##= antenna directivity using
      the clock-face as your guide.  3=East, 9=West, 15=omni
... Beacon Comment = [GR##ID] email@host.com
      where [GR##ID] is your 6-character Maidenhead Grid locator
      (be sure to put it between brackets as shown), followed by
      an eMail address to make QSLing easy
... Beacon Interval Fixed = 5
... Tune to 28.128 MHz USB and you are 1200 baud BEACONet active!
For more information, visit http://go.to/BEACONet

Watch for W2EV>HY-15:[FN03XD] on 28.128 USB!

Rendered body type: text/plain

I have also heard G0PHO, G4HBA and KB6LWN on 10 M SSB today.
  There are MANY packets that are quite strong (from at least 3 other
stations)
that I cannot decode.
  Setup here: FT-1000
3 El Yagi at 55 feet- has been pointing NE all day.
PACCOM TNC

  I am currently not transmitting on 10 M PropNet
If anyone is interested, the attachment shows the received packets today as
of 2130Z.

67. [propnet] 28.128 USB BEACONet Heard List 3-14-01

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Wed, 14 Mar 2001 22:31:18 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-511-2001.03.14-21.47.24--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The following stations were reported as being heard on 3-14-01:
G0PHO
G4HBA
W2EV
WD4RBX
N0ELS
KB6LWN
(W3MR was a lurker...RX Only)

It is interesting to note that the path from KB6LWN to WD4RBX was open,
as was the path from WD4RBX to the UK. Yet...nothing from California to
the UK. Hmmmmm. :o)

Also interesting to note: several stations are reporting that they are
seeing s-meter deflections without anything decoding. Please take a
moment to check your station (assure mic level is adequate, etc.),
especially if you are transmitting, but didn't appear on the list
above. We may have some overdriven signals out there.

To the a re-creation of the reports, in graphical format, visit the
BEACONet web site (http://go.to/BEACONet) and select the "Participation"
hyperlink...then the "BEACONet Successes" hyperlink.

Join-in on the fun!

Ev, W2EV

Rendered body type: text/plain

Folks,
Sometimes the simplest solutions are overlooked. I'd long ago forgotten
about this very simple technique of assuring that your audio is as clean
as possible. Bruce (KB6LWN) posted this to the UI-View listserve, and
thought it would be useful for BEACONet-ers, too. Since he doesn't
appear to be subscribed to our remailer, I thought it would be useful
for me to copy his message here.

Please take a moment to read this over. I'm going to find a way to
include the technique on the web site, too.

Hi Ev,

I was only testing the station last night for a little while - never
expected to be heard! Just shows that often the path can be open with no
obvious activity.

I will leave the beacon on when ever possible. I have yet to see any one
else on the map, but hopefully the weekend should change this.

Cheers. Roger (G4HBA/G8KRT)

Rendered body type: text/plain

Received this packet today on 28.128 USB:

KM5TY [EL29GQ] 1108.5 miles 221 deg.   Mar 15 15:43 EST

Also monitored a message from KM5TY to G0PHO:

KM5TY to G0PHO PATH - G0PHO>APU24A

So far this is my first RX on 28.128. Pretty cool.

I've been using PSK31 for some time for regular QSO's using Digipan.
I down loaded the PSK31 server from the UI-View site yesterday and have
used it to receive PSK data and key up the TX. I still have to configure
UI-View to work with it. Hope to have that done by tomorrow evening - then
I'll be ready for BeacoNet^31.
In the meantime any info about additional setup, frequencies etc. would be
useful.
I note all the comments on making sure that audio drive levels etc are
correct. My experience with PSK31 has shown me that it's very important
that the drive level to the tranciever is not too high. Most of the PSK31
help files have some good information about how to set this up correctly.

See you on ^31

Rendered body type: text/plain

Hi Ev,
I got the ^31 setup working this evening and I had UI-View transmitting a
burst of PSK data every minute.

An issue came up regarding frequency setup. If we use 28.128 MHz we also
have to define what position the very narrow band PSK signal will be in the
2.1MHz bandpass that most tx/rx have on ssb. Also the mode and sideband to
be used.
I chose the following for my tests.

Mode = BPSK
Sideband = usb
Transceiver Dial setting = 28.128 MHz

In PSK31Srv main window I set TX = RX and RX Hz = 1500 which puts the PSK
signal in about the center of my ssb bandpass. I found that, for these
tests anyway, it was better to turn the AFC in PSK31Srv off. This was
because there was mainly noise on 28.128 this evening (no signals)and I
found the frequency setting (Rx) was being kicked around by the noise if
AFC was on.
Rest of the setup was according to the help file in PSK31Srv. The UI-View
settings were the usual ones we use, except that I changed the interval to
1 minute, because of the much slower data rate when using PSK.

A further question: Do we want to use exactly 28.128 for these ^31
experiments? There may be others who would like to continue with the ssb
packet mode. Having multiple modes on exactly the same frequency will
increase the ambient noise level and may decrease everyone's chances of
decoding a good 'packet' - just a thought.

That's the idea - it's supposed to kick around. If it hears a signal
then it should lock onto it. If you turn off AFC, you'll only receive
any signal that happens to be exactly on your receive frequency, which
is extremely unlikely. Even if your rig is accurate to 1 ppm, and not
many will be, it's still an error of 28Hz at 28MHz. In the tests we've
done over the past two weekends, netting was found to be the biggest
problem.

There's an update to PSK31Srv available that scans over a wider range of
the audio spectrum.

Oops. I answered my own question by looking at a note I received from
Colin, G0PHO (7,912km !) While I'm not keeping official "records" of
BEACONet DX records, it sounds like a keeper, so far! (Hey
Colin...that's twice that you've been in the record books so far <g>)

I wonder...who will be the first (ax.25) W6 to UK qso? or VK to W1?
(hmmm. I don't know if we have any VK's participating).

This is very interesting stuff, indeed.

Rendered body type: text/plain

N2JR has really started something now [thanks, Rich!]. :o)

I was hoping to keep it "under wraps" for a while, but there's really no
need to do so. Think: Digipeating!

I came home tonight to see the N2JR icon on my map...only 500km away!
Upon double-clicking on his icon, I noticed that he digipeated through
KM5TY (who was also on my map)! This is *good*. It allows us to truly
begin analyzing the scope and breadth of band openings.

What I learned was this...the band was "open" from KM5TY to both NY and
VA simultaneously. So...how do we explore this feature a little more?
Easy...it's called HOPn-N digipeating.

Intrigued? Good. Stand by...the next couple of messages will talk to
activating this sleeping-giant of a BEACONet feature.

Rendered body type: text/plain

This afternoon my station picked up the following:

N2JR*   FM18CP   395.1 mi   130deg   15:58 EST

Clicking in the Station list shows:

N2JR>BEACON,KM5TY*

I followed the suggestions regarding audio levels, and have turned my Mic
Gain way down based on the results (and this is even farther down than when
I first setup). I'm hoping for more success in being heard on 10m.

Ev, perhaps the two audio-level tips that have made the rounds here on the
list (one for setting up KPC3s using the CALibrate command) and the recent
one aimed at setting Mic Gain could be included on the web site under
Configuration or Construction? I think they're very valuable, and empirical
methods for adjusting audio levels without a load of test equipment.

86. [propnet] BEACONet: Peer-class stations

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Fri, 16 Mar 2001 20:07:25 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-974-2001.03.16-19.23.28--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Peer-class stations are those who are setup to contribute to the
BEACONet network by being capable of "digipeating" other stations
signals.

Client-class stations are those who are not capable of digipeating
properly.

If you are:
1. Using UI-View software -or- 2. Level-I w/Kanrtonics TNC with ROM 8.2
or above, then you are a Peer-class station. Otherwise, you are a
Client-class station.

Any class of station can transmit a BEACONet frame and ask that any Peer
digipeat it. Only Peer's can digipeat, though. Simple, huh?

Please assure that you've setup your station as outlined below. The
next eMail will explain how to setup your station to transmit BEACONet
frames that can be digipeated by others.

Ev, W2EV

Setting up for Peer-class operation
==================================

Embedded into a Level-II installation is the following setup procedure:
- -
Exit from UI-View.

Using Windows Notepad, edit UIView.ini and add the following to the
bottom of the file:

[DIGI_OPTIONS]
UI-FLOOD=
UI-TRACE=HOP

save and exit

>From the pull-down menu of Setup|Digipeater Setup . . .
Enable Digi = x
Alias Substitution = x
HOPn-N = x
Alias(es) = your call sign
Sub Alias = your call sign
Dupe Secs = 60
<OK>
- -

If you are using UI-View...make sure that you've executed this set of
procedures. If you have...you are considered a PEER-class station and
can support HOPn-N digipeating (a good thing) of other people's
transmissions.

Alternately...if you are a Level-I station, with a Kantronics TNC with
ROM 8.2 or above, you are already setup to play too! Non Kantronics
Level-I stations are Client-class (they use the network, but don't
contribute to it's infrastructure).

87. [propnet] BEACONet: HOPn-N'ing around the network

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Fri, 16 Mar 2001 20:20:00 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-975-2001.03.16-19.36.02--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

How do you tell others to digipeat your transmission? Easy.

Station|Setup
Unproto address = BNPAH=#,HOP1-1

That's it!

When you transmit, your frame will look something like this:
W2EV>HY1G03-15,HOP1-1:[FN03XD] w2ev@arrl.net

The HOP1-1 is a "request for a single digipeat" from any Peer-class
station that hears the transmission. If a Peer hears it, the Peer will
transmit the same frame again, but insert its' callsign in the frame
(making the path trace-able!) and decrement the HOP1-1 to HOP1-0 (but it
doesn't display as -0...instead it displays as HOP1).

Suppose KM5TY is a Peer-class station and hears the above transmission.
It will retransmit the following:
W2EV>HY1G03-15,KM5TY,HOP1:[FN03XD] w2ev@arrl.net

If you received this transmission, you could quickly double-click on the
W2EV icon and discern that you did not hear it directly, but through
KM5TY!

As a matter of fact, by examining the "Stations" menu (at the top of the
UI-View screen), any digipeated callsign will include a "*"!

The valid values for "n-N" are anything from 1-1 to 7-7. NOTE: always
use the same number...do not mix numbers. Please, though...a call for
personal restraint. Please, please, please, lets' experiment with a
maximum number of 3-3. This will allow for 3 "hops" worth of
digipeating.

The idea is to not clog the frequency with digipeats, but to find a
balance that allows us to probe the ether from several angles.

Invoking HOPn-N digipeating will add a whole new dimension to our
study. Try it and see what you get!

> bit on dx cluster pages.

Hi Bruce,
As it turns out, there is no active repeater in BC. Three years ago (as
I was in the planning stages for activating the whole BEACONet concept)
I did the same research. As it turns out, there is one coordinated for
that output, but it is not active. Letters to the repeater operator
wend unanswered so I asked hams in the Pacific Northwest to try to
access the machine. None could.

Additionally, 53.51, 53.53, 53.55 are all coordinated for data in the
SERA states (South East Repeater Association) and it is now also
actually coordinated for BEACONet in Florida, NY and Maryland/DC.

In areas of North America that use 1-MHz repeater splits, 53.53 is
vacant, by default (it is 1.05 MHz higher than the national FM simplex
frequency of 52.525). This encompasses over half of the most populus
states in the country by itself.

Lastly, even in states where repeaters use 1.7 MHz splits (and 53.53
could be a repeater output), it is not in use.

53.53 is as close to a "Continent-wide unused frequency" as can be
found.

All the best,
Ev, W2EV

Normally, I don't copy personal correspondence to a remailer, please
forgive me, please <smile>...

> >Using Windows Notepad, edit UIView.ini and add the following to the
> >bottom of the file:
> >
> >[DIGI_OPTIONS]
> >UI-FLOOD=
> >UI-TRACE=HOP
>
>   Should that not be UIView32.ini?

The quick answer is "Yes". :o) A fellow BEACONet-er was giving me a
gentle nudge to remember that, although folks start out with
UI-View(16), Rogers' registration cost is so inexpensive that they often
upgrade to the much faster UI-View32 very quickly.

When I write instructions, I do so from the standpoint of BEACONet
Greenhorns who will most likely be using UI-View(16).

So...UI-View32 users...edit UIView32.ini and UI-View(16) users...edit
UIView.ini

Hi Roger!
It's really great to have you on board for the tests. More
participation is building in North America. We're about to be inundated
with even more (a major magazine is about to run an article on the
BEACONet system in next month's issue).

I've forwarded your heard-list to the BEACONet remailer, too.

It's really a lot of fun to have Europe represented. Thanks for
sticking with us...now to find Africa and South America! :o)

SPECIAL REQUEST: Roger...since you seem to have a good pipeline to North
America, would you mind opening a LOG file and capturing over the
weekend? If you get this kind of reception, I'd love to get a copy of
the log from you. We're starting to get enough active stations to be
able to run 60-minute time-outs and play back logs to watch propagation
ebb and flow.

Regards,
Ev, W2EV

Rendered body type: text/plain

Hi John (N1NCO),
You brought up a really good question and setup issue. First, thanks
for sharing your setup of BEACONet^31. I would suggest that we emulate
it until there is sufficient information to cause us to change. I've
recopied it below (with more afterward):

- -
> An issue came up regarding frequency setup. If we use
> 28.128 MHz we also have to define what position the very
> narrow band PSK signal will be in the 2.1MHz bandpass that
> most tx/rx have on ssb. Also the mode and sideband to be
> used. I chose the following for my tests.
>
> Mode = BPSK
> Sideband = usb
> Transceiver Dial setting = 28.128 MHz
>
> In PSK31Srv main window I set TX = RX and RX Hz = 1500 which
> puts the PSK signal in about the center of my ssb bandpass.
- -

As for the frequency of operation...
> A further question: Do we want to use exactly 28.128 for
> these ^31 experiments?

My first thought was to find another frequency...but then did some quick
"napkin-style" calculations of channel-loading. Given BEACONet's 1-tx
every 5 minutes, for approx 400ms in all...the frequency is fairly
lightly loaded now. If we need a new frequency, let's make that
decision based on what we find by sharing it first. Even so...let's do
a little "pre-planning". Would 28.131 (for BEACONet^31) be too close to
our work on 28.128?

I'd really appreciate comments from those with ^31 knowledge. I'm a
greenhorn in this arena (and about three hours from having everything
hooked up to play on both BEACONet and BEACONet^31 on 28.128 USB at the
same time).

These are my best results to date.

2001-March-17 09:29 6 stations

Callsign	Type	Latitude	Longitude	Km	Bearing	Last Heard
N1NCO	Grid Squ.	[FN42GL]		0.0	0	Mar 17 09:28
-KM5TY	Grid Squ.	[EL29GQ]		2570.2	244	Mar 17 09:26
G4HBA	Grid Squ.	[IO80JS]		5119.3	55	Mar 17 09:21
-KC5DUI	Grid Squ.	[EM26WE]		2067.0	258	Mar 17 09:21
W2EV*	Grid Squ.	[FN03XD]		543.3	280	Mar 17 09:03
F6DHD	Grid Squ.	[JN38QS]		5910.0	54	Mar 17 08:48

W2EV is digipeated via the UK! I note that KC5DUI/Bob also saw that as
reported in his earlier message.

In addition to packet, I also have PSK31srv 1.04 running. I transmitting
a 31^ burst about every 1 minute and a normal packet (via the KAM) about
every 20 secs. (the 31^ packet burst seems to take about 10 seconds)
I have been monitoring the PSK31srv waterfall window, but have not yet seen
anything that looks like a PSK signal although there is lots of other stuff
there as would be expected.
PSK31srv is set up TX=RX and the "scan" is turned on. Other scan settings
are default. I'd be interested to know if anyone has heard my ^31 signal.
Antenna in use here this morning is a 6M Jpole loaded up on 28.128 with an
MFJ atu at about 9 meters.

Rendered body type: text/plain

Wow. The ability to digipeat has really opened up our tracking ability! I now see double the number of stations that I had otherwise seen. I'm very impressed with our successes so far! I just wish I knew what it would take to get South America, Africa, Japan or Australia interested!

Anyway...here's my request: Starting late tonight (say, arount 9:00 pm local time), open a LOG file and keep logging for 24 hours. By 9:00 pm tomorrow, close the log and eMail it to me. Why? Because I have a way to play them here (in "hyper speed"), capturing the playback to a movie! I'll set the "expire" time to 15 minutes and watch as icons come-and-go with changing conditions. I'll take the "best" movie and put it on the web site for others to see! (I've never tried this before, but how tough can it be? <smile>).

I say this is a "one time request" because I really don't have the time to do this on a regular basis, but the results from yesterday and today are really exciting! :o)

Regards,
Ev, W2EV

w2ev@rochester.rr.com writes:

> open a LOG file and keep logging for 24 hours.

Hi Ev
Does it make any difference as to what expire time to use? I usually set mine to 0 and clear it every 24 or so hours. I don't run a log file most of the time.

< I just wish I knew
what it would take to get South America, Africa, Japan or Australia
interested!>

What about looking for packet clubs (basic idea) on the Internet and drop them a line?

Hi Ev,

I have now configured the station to run as a 1 hop digi, and it seems to work fine. The station here is an IC706 Mk1, 100 watts into a 28 MHz Bi-Square loop with the top at 45 ft agl. The computer is a Cyrix 6x86MX which runs UIVIEW32 and AGWPE.

The station will be on air until 22:00z today. As we are not allowed to run unattended HF tx in the UK I will leave the system on rx only for the rest of the week. I have got a log file for yesterday and will do another one for today. I have set the map refresh to 60 minutes to show better the time scales of propagation shift.

Here is my heard list for yesterday.

```

The expire time only affects playback, not recording. The log file that
one generates is not affected by expire time settings.

Ev, John and the group. I'd like to indicate that there is a collision course being show here and we need to do something about rather quickly. In ordinary FSK the worldwide "rule" was: The lowest emitted frequency will be considered MARK and indicated as the channel frequency. In PSK, FM and similar modes, there is no "lower frequency" as such so the center must be considered the "channel". My point is that we should NEVER consider what tones are required by any individual station. Some will use 1500 hertz and many other others whatever is required. If 28.128 MHz is specified then that frequency is what is transmitted +/- modulation products. Otherwise mass confusion is bound to happen. Cliff K7RR

I don't really agree with that. With PSK31 I think it's easier to split
it into two parts:-

1. The frequency (and sideband) to which you tune your rig.
2. The audio tone you use.

It's very easy to follow the instructions "Tune to 28.128MHz, USB, and
use an audio tone of 1200Hz".

(Of course, no matter how you specify the frequency, unless everyone
uses rigs of above average calibration accuracy, the end result will be
signals spread over 100Hz or so.)

Unfortunately, you illustrate the very basis for mass
confusion! There are far more modes coming down the road
than PSK 31, but lets use that example. PSK 31 does not care
what sideband is used but other modes do. It is up to the
operator to determine what tone is best as well as filter,
DSP and demodulator. Many modes will perform well without
any signal being heard. We HAVE to find a standard and stick
to it as the commercials had to in years past. Cliff K7RR

I think there is a need to standardise the set up procedure fairly quickly
if we want to get anywhere. Pulling in weak signals is difficult enough
without being uncertian as to the exact frequency and tone being used. We
should stay as close to the usual conventions as possible so long as we can
meet our needs. The important thing is to have a setup procedure that we
all agree on. There is an interesting waterfall calibration procedure in
the Digipan help file that we might want to look at as an aid towards
developing our own.

As Rodger pointed out in an earlier message, even if you have both stations
on exctly the same frequency, using an agreed tone, the chances of both
tranceivers being within the required limits for accurately decoding PSK
are quite small. Rodger has tried to accomodate that by building the "scan
function" into PSK31srv. I assume the idea is that if both stations use the
same dial setting and tone, then they should be close enough for the scan
process to "pull it in" the rest of the way, so that the PSK decode can
work.

Bob (KC5DUI) and I tried a brief experiment with PSK31srv yesterday
afternoon. I found it was very difficult to lock on to his signal, even
though it was quite strong and decoded well once it was locked. In every
case it required manual intervention to move the cursor on to the signal,
even though the scan function was enabled. I found that sometimes noise
(possibly a regular packet) would kick the cursor away from the PSK signal
at the last minute.
We did not have very long because conditions started to deteriorate, but I
would have liked to have tried adjusting the scan delays and SQL to see if
that would help.
It's certianly not "set and forget" like regular packet is at the moment.
but it certianly has possibilities......

A final comment, because this could start to go round in circles:-

If I say "Set your rig to 28.128 USB, and TX an audio tone of 1200Hz"
can you manage to do it? Of course you can, and so can everyone else,
because (a) every modern rig has a digital frequency read-out, and (b)
every PSK31 program allows you to set the audio tone frequency.

If I say "Transmit with a centre frequency of 28.128MHz" can everyone do
it? I'll bet that some will need a little help. What form will that help
take? It will take the form of "Set your rig to 28.1268MHz USB and TX an

audio tone of 1200Hz". And we're back to using my method... (Of course
you can also say "Set your rig to 28.1292MHz LSB and TX a tone of
1200Hz", but it still amounts to splitting the exercise into two parts,
exactly as I was suggesting.)

However, to replace theory with practice, we've been doing PSK31 / APRS
tests in Europe for two weeks now, with considerable success. We've been
specifying the frequency in the way I am suggesting, and no-one seems to
have been confused by it.

What version were you using? From the tests on 20m in Europe this
weekend, the general opinion seems to be that the new AFC system in
V1.04 works well.

Hi Rodger,
          I was using V1.04, but this was the first time around and
conditions were far from ideal. It's good to know that you had good success
with V1.04, hopefully we'll have better luck next time.

Next weekend I'll try 28.128 USB, with a PSK tone of 1200Hz and see what
happens.

73- John

Hi All

I hope I don't get shot for putting a message up that has nothing to do with packet.

Today the wife walked in and handed me a microphone and told me that my dad's friend sent it to me. At first glance I thought it was really cool. It is about 2 inches round with a nickel size ring at the top. I looks like it is made of black plastic. What really peeked my curiosity was when I turned it over it had written on the back "Edwards and Company Norwalk,Conn. With in a triangle in the center is written "Edwards 1872" I could not find any information on this Mic. If you know anything that could help me please E-mail me off the list.

I too was using V1.04 and had trouble staying on top of John's (N1NCO) signal. What frequency is being used in Europe for the tests? Using 28.128 the AFC locks on to the packet bursts (just the way it should when a signal is present) and jumps quite a ways from where the PSK31 signal will be. Had nice clear copy on John when I'd click on his trace. Several times when I let the AFC find him I'd get the end of his callsign and had numerous plots on the map - N1NCO/1NCO/NCO/CO. We were both using DE CALL (our calls) in the Preamble Text - a longer preamble might have been better to allow the AFC to synch up but then makes the transmission time longer.

Experimentation is FUN!

Bob - KC5DUI - EM26WE

We're not trying to share a frequency with packet, but on 20m, where I
was listening over the weekend (14.095MHz), there was an RTTY contest,
so we certainly weren't using a quiet frequency.

>AFC to synch up but then makes the transmission time longer.

Make sure you've read the "How Scanning Works" section of the help. A
couple of points that derive from how it works are important:-

1. With the default settings, every time the scan function steps the
frequency by 50Hz, there is then two seconds for it to find a signal
that lifts the squelch. If it doesn't find a signal in two seconds, it
steps again. If you have the squelch set too high, or set to slow rather
than fast, then the squelch won't lift enough, and it will move off the
signal. I set the squelch to about 20% of the way up the signal quality
bar.

2. The wider the scanning range, the greater will be the average number
of scanning steps needed to find any given signal, and so the less
likely you are to find the signal before the preamble ends. If the
scanning range is set to zero, it will still seek within +-50Hz of the
set frequency because of the AFC. However, I don't think everyone will
be able to achieve that level of accuracy, which is why the default was
made 100Hz.

I would recommend putting it in receive-only mode on 14.070MHz USB,
where there's always some PSK31, playing around with the settings and
watching what happens.

One other point - If a signal shows significant IMD products (spread) on
the waterfall, either because it's a poor quality signal or because it's
someone very local, then the AFC can stop in the IMD products rather
than seeking to the centre of the signal, because it finds something in
the products that appears to be valid PSK31.

Rendered body type: text/plain

Hello,

Last weekend (march 17 and 18) I made my first Beaconet tests, and gave very intesting results...
The rig here is : IC756 3ele beam on 40 feet tower, UI-view32 1.54 & pk232 kiss mode.
At the end of the week end, I hope UI-view and PSNPAH-D was correctly set up ;-)

To assume Level 2 capabilities, did any one made some tests with TNC2 with UIDIGI eprom? I tried it
locally on the table and it seems to do the job.

I'll try to be more often on the air on 28.128

Hello Chris! You were received by many stations last weekend. I am
also interested in the UIDIGI eprom, but haven't had the time to
experiment with it. Does it support HOPn-N (TRACEn-N)?

It's good to have you participating!

Ev, W2EV

Has 10M Propagation gone away?? I've left UI-View running on my computer
while at work the last two days and haven't had a single station appear.
Have I broken something I'm not aware of?

Bob - KC5DUI - Sprindale, AR - EM26WE

There is a major geomagnetic storm going on and that will affect 10 meters
first and
for the longest time compared to the other HF bands. Check out:
http://www.sec.noaa.gov/SWN/index.html
and
http://www.spaceweather.com
for the latest solar and auroral conditions.

Do you have either:
1. A Cable modem (1 min, 20 seconds) or better?
or
2. Time?

:o)

Check out a time-lapse video of what BEACONet (28.128 MHz USB) looks
like from the UK! Hit the web site (http://go.to/BEACONet), select the
"Participation" hyperlink, and "BEACONet Successes" hyperlink.

It's nothing fancy...I'm not much of a web-guy, but I'm having a lot of
fun documenting this stuff. If you've been lurking, this may be a good
opprotunity for you to see what fun you've been missing out on.

Join us, would you?

Ev, W2EV

We're especially looking for participants from Africa, Central and
Eastern Europe, Australia.

Playing devils advocate a bit here...

> > "Everyone knows that FM-based data-modes:
> > * are not capable of propagating over large distances
> > * are in no-way capable of being used to indicate band-openings"

Can anyone describe a technically worse DX mode then AFSK FM packet?
It could be developed - but it wouldn't be easy.

I think this is a great project - but that's an important point
to remember.

My first ever 6 meter signals were DX packets. Back in 1990, or was
it 1991, I came home from work one night and found two stations in the
heard list. This was on 50.7(?) - the old packet simplex frequency. There
was a great E-Skip opening that day and I was picking up a couple stations
in the Reno area, from Fort Collins Colorado. Now that was cool.
I need to order some 53.53 crystals for the IC-60 and get it back on the
air. The E season must be just around the corner.

How many folks have CW id turned on so folks without computers can
participate. The same beacon info could be sent in CW. That would
also allow recovering weak signals where packets couldn't be decoded.

Anybody else using the DX bulletin feature of Digi_NED? It watches
for "DX" by a configurable time period and sends out DXCluster compatible
bulletins when new DX is received. I've been running it on 10.151 for
the past 6 months and it's cool to watch (and record!) the changing
band conditions.

Bill - WA7NWP

:-) :-)

Ev, could you do two things for me? First, my legal name is Walter,
although I go by Terry. So please make the copyright read

Copyright Walter T Heatlie -- all rights reserved.

Second, the link to my page is broken. You have

<A href=http:/www.nortius.org/ham/beaconet>

There is a typo - you need two slashes before the host portion:

<A href=http://www.nortius.org/ham/beaconet>

Thanks!

D'Oh! obviously that was meant to go to Ev. Curse the list software for
re-writing "Reply-to". Must remember to check more closely in future...
I tend to agree with http://www.unicom.com/pw/reply-to-harmful.html, that
lists shouldn't do that.

Rendered body type: text/plain

Hi folks,
I've been beating my head against the wall, trying to get my PC
soundcard to work and have come up dry (maybe it has something to do
with the fact that the wall is plaster-and-lathe...I dunno) <smile>.
The only thing that I can think of is that I'm down to a driver issue.
I'll get this solved by monday and be playing on BEACONet^31 by then.

Questions...is anyone else activly experimenting with BEACONet^31? What
have you found so far? Are you sticking with 28.128, QSY'd to 28.131 or
somewhere else? I'm very excited about it, and am sad that it's taken
me so long to troubleshoot my computer problem.

I'll be BEACONet^31-ing on Monday!

Ev, W2EV

Date: Sun, 25 Mar 2001 07:49:37 -0800
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-2746-2001.03.25-10.07.55--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

- eta-Aquarids METEOR SHOWER REGISTRATION PAGE NOW OPEN -

Web Page registration is now available for those who will be participating
in the upcoming April eta-Aquarids Meteor Shower event. The purpose of
registering is to provide a real-time list of participants. This should
expedite communication and increase the chances of success. It should take
about 1 minute to register. Click on the URL below and then click on
REGISTER HERE.

http://w9if.net/cgi-bin/beaconet/main.pl

NEW WEB PAGE FEATURES:
o TX Power options coincide with the new specification.
o Antenna length options coincide with the specification.
o Antenna direction has been added and coincides with specification.
o 10 meter band has been added as an option
o If you make an error while registering, you can now register again
o Added a "Probability of Success" icon
o Web page layout significantly updated
o Added Map showing "POS", antenna direction, and antenna beamwidth

I got interested in this facet of amateur radio after reading the article
by W2EV in the Nov 99 issue of QST. I quickly realized that my chances of
success could be increased if I knew who was participating so I knew where
to point the beam. It was out of this need that I developed this
registration page. I hope that you find it useful. For those interested in
more information, the Nov 1999 QST article by W2EV and the Nov 2000 issue
of QST (page 28 and 83) may be useful.

thanks, W9IF

Rich Parry

Hi all

I borrowed a friends Radio Shack HTX 100 and today I hooked it up for 28.128
BEACOnet. It was plug and play all the TNC to radio cables from my MFJ 1270C
to Kenwood TM2550A worked perfectly on the HTX100. The first thing that I
noticed when I switched from the RCI 2950 to the HTX 100 was the DCD light
blinks quite a lot more even with the volume turned down to a comfortable
level & open squelch. Ill be running this rig on BEACOnet for the next few
weeks. I would like to know If anyone RX my beacon (Tune and Play test).

Thanks
Rich

Well, I'm "on the air" today with BEACONet^31.

I've setup the system on 28.128 USB (right along with the standard AX.25
stuff) for TX=RX and a center frequency of 1500 with scanning enabled
(thought those may be conflicting parameters...I'll read the help files
a bit more tonight).

Is anyone else playing on ^31?

Ev, W2EV

May well be pertenant to my local setup only - but the Java Applet here
craters Netscape.

System: Dual P-III 800s, 256MB RAM, W2K, N-scape Communicator 4.76

Sequence:
Visit page - Javaloads
Fill in requested data
Run Configuration code generator - get good result.
Click on "File > Exit" to Close N-scape
N-scape hangs (browsers, email, all of it) and lists as "not responding"
in Task Manager
End Task N-scape with Task Manager
Rest of system seems fine

Re-start N-scape
Starts up and functions just fine
If I revisit the Code Generator and generate a code - same results.

FWIW - other Java enabled pages don't seem to do this. ie. J-tack,
etc...

Been able to reproduce this several times. Even tried a cold boot
in-between to clear any 'MS crud' - no joy.

Open to ideas and suggestions. Like I say, it may well be my setup here
and not the applet. Special if no one else is having any probs.

In any case - this is a great resource - thanks Terry!

Cool! Very cool! the "junk" at the end is as a result of the CRC being
activated. I'll be continuing on BEACONet^31 all week and probably
returning to "regular" AX.25 BEACONet for the weekend. It appears as
though unattended operation in Region 1 is rare (and activity there
seems to be limited to to weekends as a result).

Ev,

I've set up on 28.128 USB with 1500 set in the TX window. Have SCAN on but
left TX=RX unchecked so that I should always xmit at 1500 (if I understand
things correctly) and the receive will search for a signal.

Will leave this running unless we have forecast for thunderstorms.

Hi Ev,

I also received "bits and pieces" of the W2EV PSK31 beacon yesterday
afternoon. I will listen out for it again today.

As a general comment to everyone who is starting to try PSK31Srv - make
sure you're not overdriving the rig. It's very easy to do, because the
output from a sound card needs a lot of attenuating before it goes into
the mic socket of a rig!

Ideally you need someone who can receive you at reasonable signal
strength to give you an IMD report. You should aim for -20 or better
(less is better, so -25 is better than -20). A poor IMD can make the
signal difficult to copy, and makes it take up too much bandwidth.

It seems to always come back to the simple stuff, doesn't it? :o)

Pardon, my PSK31 newness is showing. :o) I really had no use for it
before BEACONet^31. Other than trial and error (gee, why do I hear
everyone, but no one replies to my transmissions?), is there a way to
know if one's signal is being overdriven?

If this is a commonly answered question, please point me to the
resource, and I'll read all about it, rather than wast folks time.

Rendered body type: text/plain

A couple of folks have mentioned hearing "bits and pieces" from me on
BEACONet^31. Can anyone clarify a little? I'm wondering if that means:

* very few complete transmissions are being heard (only partial
  receptions)
-or-
* only sporadic transmissions being heard, but they are complete
  when they are received
-or-
* something else?

I knew that PSK31 was a lot slower than 1200 baud data, but I'm amazed
that the whole transmission takes some 17 seconds for me...which doesn't
bode well for channel loading until the "next upgrade" (ability to
receive multiple frequencies in the passband at the same time, according
to the help file). A minor "future issue" for now, though.

This is GREAT fun!

I'm continuing on BEACONet^31 through the rest of this week. Join us,
if you can!

The IMD reading from another station is the best guide, because that
measures the quality of your on-air signal. However, turning the drive
down until the power output from the rig drops back from maximum is a
good starting point.

Rendered body type: text/plain

Hey, BEACONet-ers...it's official: There will be an article in the May
QST dealing with the propagation plotting nature of BEACONet (with a
very small note about BEACONet^31)! If past experience is any
indication, expect that there will be a large influx of new participants
in our experiments.

If you've not had the chance to power-up, please use the next two weeks
or so to do so. Chances are, there will be someone within RF range of
your station who may need a question answered or issue clarified.

We've seen that the BEACONet system holds great potential, when a
critical mass of participants is reached. We should have a ton of
participants this spring and summer. Here's your chance to be a green
horn's first BEACONet reception. Power up and join-in now, if you can!

154. [propnet] BEACONet Meteor Burst Mode Opportunity

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Tue, 27 Mar 2001 07:22:38 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-3052-2001.03.27-06.40.28--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

In case you overlooked it, there is a chance to "shake out" our Burst
Mode stations, in the form of the eta-Aquarid meteor shower coming up.
No one has ever tried to make this shower work, but the meteor count and
velocity suggests that it should provide some usable "burns" for
BEACONet "probes".

To be "marginally" successful as a transmitting station, one will need
the following approximate ERP levels:

28.128-MHz 50-watts (estimate, we've never tried on 10-meters before)
53.530-MHz 100-watts (100w to a dipole, 40-watts to a 3-element beam,
                      etc.)
147.585-MHz 400-watts
223.780-MHz who knows? :o) But I'm going to be trying!

MORE RF OUTPUT = BETTER SUCCESS POTENTIAL

On the RX-side, stations with vertical monopoles have heard BEACONet DX,
but here again, a small beam is a good idea, if you have one to use.

Rich Parry (W9IF) has developed an *incredible* web site to document
anyone who is willing to participate. Just visit the site and register
your intent. That way, we will know where to point our antennas for
best opportunity to be heard by someone! Find configuration information
on the web site (http://go.to/BEACONet under the "Configuration"
hyperlink).

More on this exciting BEACONet mode a little later. Join-in...its
v-e-r-y easy to do and fun to see what you catch on that falling star!

I will be playing on 28.128 with 50 watts and 6 elements. I am going to
register for 223.780. I built a new beam 13 element Quagi and will be running
110 watts. My only reservation is that I will not be able to get this beam up
more then 20 foot or so.

156. [propnet] SOLAR ACTIVITY

From: RickfordG@aol.com
Date: Tue, 27 Mar 2001 07:56:22 EST
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-3055-2001.03.27-07.12.38--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

SOLAR ACTIVITY: In recent days the Boulder sunspot number has rocketed to
339, its highest level since July 2000. At least one large sunspot group
has a complex magnetic field that could harbor energy for powerful solar

flares. Forecasters estimate a 20% chance of an X-class eruption during
the next 24 hours.

AURORA WATCH: An interplanetary shock wave buffeted Earth's magnetosphere
Tuesday morning and another may be following close behind. A coronal mass
ejection that left the Sun on March 25th will arrive late Tuesday or
Wednesday and possibly trigger additional geomagnetic disturbances. In
recent days Alaskan sky watchers have enjoyed some of the best auroras of
the current solar cycle.

Hi Ev

I think that my reception is do to back scatter and very weak. The best
signal from you was when the beam was pointing east.

Rich

PSK31 is only 31 bits/sec... It's strength is in weak signal reception.
You can sometimes receive a signal when, to the ear, there's nothing but
noise.

Just wish it were mine!

It's the company's - seems my boss convinced TPsTB I'd need 'real iron'
to the job he hired me for. Nice guy. Mmm, now to dual boot this thing
with LINUX, get the Q-III server up...

Brings up a good point, I aughta to try IE 5.x
(http://www.satirewire.com/news/0103/outlook.shtml) on W2K and then
N-scape, etc. on the LINUX box..

Terry - info you requested will be on it's way, off list, shortly.

More later!

Rendered body type: text/plain

I thought I would run this idea by the group to get your feedback...

When considering the transmission window for meteor scatter events I think many of us have run into the situation where we would like monitor activity within our own quadrant. During the Leonids this year W2EV (NE Quadrant) picked me up, and during the Leonids of 1998 nearly all of the 5 stations that heard me were also in the NE quadrant.

Building on the proposal to use the clock face as a direction analogy for beam position, I thought we could also use it to time our 15-second bursts. In short, a station's 15-second slot begins in the minute at the same clock face position as its beam heading.

So, if I'm beaming -4, my 15 second slot starts at 20 seconds into the minute. This may maximize the ability of stations aiming at each other to make contact:

Station A sets beam direction to 90 degrees (-3)
Station B sets beam direction to 270 degrees (-9)

Station a transmits from 15 to 29 seconds, station B transmits from 45 to 59 seconds.

Omnidirectional stations could transmit in the minute by following the current quadrant method.

The disadvantages I see are:

** If 4 or more stations all in a local area (hearing each other direct) orient their beams 90 degrees to each other, it's all transmit and no receive for them.
-- However, this may not in actuality prove to be so, since the population of participants around the country is clustered, and those of us close to each will probably be transmitting around the same time, trying to hit a cluster of folks in one part of the country or another.

** If two stations are beaming in the same direction (e.g. 180 degrees), and their locations form a straight line in that direction, the station closest to the intended destination will never hear the station farther away because they're transmitting at the same time.
-- In real life this may not be so bad either, since the station closest to the intended destination could only pick up the other station off the back of the beam anyway.   For example, Station A in Detroit points beam 135 degrees toward Washington DC. Station B in Pittsburgh points beam 135 degrees toward Washington DC. Station B will probably never hear Station A because they are both transmitting at 25 seconds into the minute.

This scheme would maximize the slots for those stations pointing at each other. It may prove to minimize receive time if several stations are close and can hear each other direct. In those cases, however, I would hope that local coordination among the stations would help. I have two other guys within 20 miles of me, and we seem to gravitate to either overlapping slots with FULLDUP on, or shortening our transmit periods from 15 seconds to around 8 or 10 seconds.

What do you think?

Rendered body type: text/plain

Hi Gang,
I'm going to need a little help on this one. I recently got an eMail
message that said the receiving station was hearing a signal that should
have been strong enough to decode, but it didn't. Upon further
observation, there was evidence to suggest that the transmitting station
was attempting to send 1200 baud packet in "narrow shift" mode (200 hz).

Apparently, PK-232's and PK1200's have this feature, but I don't own
either to do any verification.

Does anyone care to comment in this?

Ev, W2EV

John,
Thank you for the report. Today, I followed Roger's suggestion and
readjusted my microphone gain for about -1dB of RF output. This placed
my mic gain at 9 o'clock, by the way.

John...be sure to let me know if you get a better IMD level on the next
reception of my signal, would you?

This is fascinating. :o)

      Just a quick one -- if I'm reading this right, the MFJ 1270B will
also do this. All you have to do is mistakenly hit the HF/VHF TONES switch
on the back panel, and suddenly you're doing 1200 BPS with the wrong tones...

166. [propnet] BEACONet-ers...check your TNC's!

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Thu, 29 Mar 2001 06:23:38 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-3510-2001.03.29-05.41.35--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

It appears as though it is possible for folks to be setup to operate
using 1200 baud tones, while using only a 200hz shift (!!). This will
munge your transmissions.

Some TNC's have a button on them that allows you to select "Wide" or
"Narrow" shift. Some TNC's may even label this as "VHF" and "HF". But
don't forget that, in the USA, 10-meters is the *ONLY* HF band on which
"Wide" is allowed! If you have a TNC with this option, make sure that
you are using "Wide" or "VHF" settings for all TNC-based BEACONet
operations from 28.0-MHz and up.

167. [propnet] BEACONet^31 still going...

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Thu, 29 Mar 2001 06:32:18 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-3511-2001.03.29-05.50.11--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm still transmitting BEACONet^31 on 28.128 USB, but I've received
nothing to date. I have a feeling that my transceiver isn't as good of
a receiver as it ought to be (of course, having the antenna 15 feet off
the ground has something to do with it, I'm sure).

I've recently dropped the Mic gain until I saw a 1-dB drop in RF output
(as compared to maximum RF output), and my TVI reduced
s-i-g-n-i-f-i-c-a-n-t-l-y. I highly suggest this as a procedure for all
operations (funny how you forget the simple stuff, huh?).

Anyway...I'm interested in any "heard" reports and IMD readings on my
signal, if heard please. I will be staying active until Friday night,
when I'll return to "regular" BEACONet (AX.25) for further tests with
folks in Central Europe and North Africa.

Join-in on the fun, if you haven't already!

Hi Ev

I am thinking that the signal was mine. I borrowed a HTX 100 from a friend.
He told me that he was having mic problems and I told him I did not need the
mic for BEACOnet. It could very well be the radio and not his mic. I know
that this radio will receive BEACOnet beacons but I have not received any
sense I started using the rig. Was the station that heard the undecodable
beacon TX a beacon? If so then it might not be the HTX 100. My beacon will be
off today do to the threat of thunderstorms.

Rendered body type: text/plain

We've never tried to exploit the eta-Aquarid meteor shower before, but we're going to give it a try this year. I'll be using the data gleaned from the event in an upcoming article that will be submitted for publication. If you participate, you may even see your station mentioned in print! :o)

There's time to get ready (about a month yet), so start getting ready now. Full instructions for setting up UI-View for Burst Mode may be found on the web site (http://go.to/BEACONet) under "Configuration" and "Burst Mode".

Get all the power that you can muster. More is better. A 160-watt amp on 2-meters will play better than a 50-watt transceiver. As a matter of fact, there is data starting to build that suggests that a moderate antenna and high power actually perform better than a large antenna and moderate power because the beamwidth of the smaller antenna will bathe the sky better.

Join us for the fun. There's still plenty of time to get ready. The Event Regristration page is up and running now at http://go.to/METEORegistry (thanks, Rich!). If anything is unclear, ask on the remailer, there's plenty of help available from others who have done this before!

Rendered body type: text/plain

Hi Rich,
The HTX-100 has a "high cut" filter associated with one of the keypad keys... "5" maybe? Check out the manual and make sure that it isn't activated. That will cause problems if so.

The station that reported hearing a "munged" beacon was in Kentucky, probably too close to you to have heard you...but you never know. :o)

>   MAJOR CLASS X1.7 SOLAR PROTON FLARE ALERT
>
>   Supporting imagery is available at:
>   http://www.spacew.com/astroalert.html
>
>   A major class X1.7/1N solar proton flare was observed erupting from the
>mammoth naked-eye sunspot group identified as Region 9393 at 10:15 UTC (5:15
>am EST) on 29 March. This event, although not tremendously large in spatial
>size, was very bright in x-rays. Increasing energetic proton densities at
>greater than 50 MeV (million electron volts) from the event began to be
>observed shortly after 11:00 UTC (6:00 am EST). Protons are expected to
>continue gradually increasing in density throughout the rest of the UTC day.
>There is a risk of proton densities becoming strong enough to begin causing
>minor satellite anomalies (single event upsets, phantom commands, etc).
>
>   A fairly well defined Earth-directed full halo coronal mass ejection was
>observed emanating from the Sun, beginning near 10:26 UTC in SOHO spacecraft
>imagery. An accurate time of impact of this disturbance is not yet available.
>However, it is a reasonable estimate to assume that the disturbance will
>impact the Earth on 31 March or perhaps 01 April.
>
>   The impact of this latest coronal mass ejection should come on the heels
>of the anticipated impact of an earlier coronal mass ejection (currently
>expected to impact on 30 March). This series of events is likely to result in
>a prolonged period of enhanced auroral storm activity during the 30 March to
>01 or 02 April time frame. Observers interested in watching for auroral
>activity should keep a close eye on the sky and conditions during this time.
>
>   An addendum will likely be posted later today concerning this event.

Hi Ev,

Have had my rig transmitting on 28.128 USB 1500 for the last several days
and hadn't seen a thing. This evening when I checked I had "partial" copy
on you and F6DHD sometime during the day of 29 March. Never received the

full call on you to have a plot on the map but did get .... EV>HY0G02 ....
[FN03XD] w2ev .... from you and .... HD>HY1G13:[JN38QS] f6dhd@free.fr ....
(at least that's what I could piece together from a number of garbled lines
and even what I think I received could be garbled). Will stay on PSK31 mode
until Friday evening then switch back to packet.

Bob - KC5DUI - EM26WE

174. [propnet] An Invitation from the Asia-Pacific Rim

From: "APEC" <apec@chinanusa.com>
Date: Wed, 28 Mar 2001 17:57:03 -0800
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-3680-2001.03.29-19.27.39--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Aiming at Asia-Pacific Market?
Here's your one and only chance this year to target
21 developed and developing member economies in the Asia-Pacific rim
<http://www.apec2001.org/apec_member.asp> .

 Industrial Science and Technology Cooperation
 Conference and Exhibition
 September 21 - 25, 2001
 Suzhou, China

 An hour's drive from Shanghai, the biggest city in China

Who Should Attend
*   Technology-oriented companies who want to   demonstrate
advanced technologies or to seek   joint ventures
*   Venture capitalists and other investors who   want to identify
promising high-tech   companies and investment opportunities
*   Entrepreneurs who are seeking market   expansion to the
Asia-Pacific region

Best Chance to Showcase Technologies
*   Exhibition & transaction of high technology &   hi-tech
products.
*   Bid for technological cooperation.
*   Discussions & negotiations on technological   transaction and
cooperation.
*   APEC forum on science and technology.

All the Opportunities!
*   Technomart is endorsed by APEC's 21   member economies that
had a combined   Gross Domestic Product of over US$18 trillion   in
1999 and 43.85 percent of global trade.
*   In Technomart III, attendees included 1,000+   hi-tech
exhibitors and recorded 37,000 visitors.
*   In Technomart III, over 5,000 business   negotiations
occurred, involving trade in   excess of about US$ 100 million over
the   course of the five-day event.
*   Direct connection to China market.

        Service Center
*   Technomart representation
*   Exhibition Booth & Expense
<http://www.apec2001.org/apec_booth.asp>
*   Booth arrangements and allocation
*   Transportation
*   Hotels <http://www.apec2001.org/apec_hotel.asp>
*   Sourcing/manufacturers visits
*   On-site public relation facilitation, media   coverage
*   Collateral translation
*   Escort interpretation
*   Leisure touring in Suzhou and its vacinities

Key Technological Areas
*   Biotechnology

```
*       Environmental and cleaner production     technologies
*       Communication
*       Information technologies / electronics
*       Advanced materials
*       Mechatronics
*       Transportation
*       Resource management technology
*       Energy
*       Sustainable agriculture
*       Emergency preparedness and climate     prediction
*       Exploitation of natural resources

Did anyone else see the Northern Lights tonight (Friday)? They were
really bright, at least to my "southerners" eyes...

      Tried some ham radio, but I couldn't get any answer at all. Oh well
-- maybe next time!

      7 3
      Earl

Earl - Au was visible on EM42/EM52 in central Mississippi from about
0630-0700 UTC. Never seen it this far south. Simple reddish glow to
north. Worked FN02, EM49 and EM36 and heard many others (TN, WV) via Au
on 6m. Will monitor for hour or so more but it has quited down.

Bruce, KD5IUG

There's a radio aurora here at the moment (07:50 GMT Saturday) with
strong signals on 2m.

There is some very sporadic aurora activity on 50.110 on the east coast
(fm29), right now 8:30z.

Yes! Two contacts on 222.1cw and 432.1cw with lots of signals on
2-meters. Nothing on 1296 (rats!). I was really hoping to find someone
willing to try, at least. :o)

One of the "interesting" observations that folks have made over the
years of playing with Au is that contacts with your own latitude are
easier than ones more north or further south. As a matter of fact...the
"radio range" of an aurora is best described as an East-West oval, if
drawn on a map.

If you're interested in why, I can explain. Think of the Au as a bunch
of "curtains" (hence the term "Auroral Curtain") that are not perfectly
perpendicular to the earth. At a distance, they are "close" to
perpendicular, however, the closer they get to you the less "surface
area" you have, because you start to look "up" or "between" the
curtains. With even more intensity, it is possible for northernmost
stations to actually be "behind" the Au...not able to propagate at all!
(check this out for a graphical representation of what I mean:
http://www.rochesterny.org/PropNET/Aurora/)

This is the frustration with extremely intense Au activity for
Northerners trying to set new DX records. One needs an Au that is "just
right", not too intense or weak.

All this is to give folks who haven't experienced Au some insight
(individual results may vary a bit) into what to expect from Au: a very
good chance at E-W propagation, a decent chance at N-W...however the
chance lessens with the separation between N-S stations at a rate that
is greater than that of E-W stations.

Lastly...don't forget to "move the antenna". The curtain is "thicker"
in some spots than in others. Point west of north to work stations in
that direction; east of north to work stations in that direction.

Good luck eveyone...maybe a repeat tonight? We'll see!

At 01:19 AM 3/31/01 -0600, Bruce Brackin blasted the following out into the
ether:
>Earl - Au was visible on EM42/EM52 in central Mississippi from about
>0630-0700 UTC. Never seen it this far south. Simple reddish glow to
>north. Worked FN02, EM49 and EM36 and heard many others (TN, WV) via Au
>on 6m. Will monitor for hour or so more but it has quited down.
>
>Bruce, KD5IUG

      Bruce, this was the second time in my life that I've seen aurora -- I
just haven't spent enough time up north, I guess. It was REALLY bright
here, and actually LOOKED like a "curtain", as you hear people talk
about. Funny thing, it was green down low, but RED, RED, RED up in the sky.

      I'm REALLY surprised that my 6 meter setup didn't receive any
BeaconNet stations.

      DM84 here, BTW.

Actually, don't be suprised, Earl. I'm not sure if there has ever been
a documented auroral contact using FM, let alone packet data. There is
a lot of doppler spreading that takes place, once a signal is reflected
from that constantly moving/oscillating curtain.

Ev, W2EV

BY THE WAY...
Maybe this is our chance to try! I'm back on BEACONet on 10-meters
(28.128 USB AX.25) for the weekend. It would be interesting to see if I
get any stations within 500 miles or so...direct!

Hmmm... I wonder if this is a case where PSK31 would have provided a
major benefit, with it's error correction? I dunno. Being PSK, the phase
distortion caused by the aurora doppler would probably still wreck
enough havoc to prevent even enough demodulation to correct errors.

Just thinking out loud... never mind me.

Glad everyone got to experience the aurora. Too bad I missed it - and I
was up at the time!

185. [propnet] Re: Aurora! on 10m?

From: "RWeinkauf" <rweinkauf@msn.com>
Date: Sat, 31 Mar 2001 13:48:19 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-4007-2001.03.31-13.04.44--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

This morning I received a message from Bob, KC5DUI, letting me know he
received one packet from my station at 0602 UTC on 28.128:

2001-March-31 15:52 2 stations

Callsign   Type   Latitude   Longitude   Km   Bearing Last Heard
--------   ----   --------   ---------   --   ------- ----------
-KC5DUI   Grid Squ.   [EM26WE]   0.0   0   Mar 31 15:42
+N8QLT-10   Grid Squ.   [EN82HL]   1158.6   50   Mar 31 06:02

This is very interesting to me because it was one packet, near the height of
aurora activity, and well past the time of night you would expect F2
propagation on 10m. Bob has a N-S oriented dipole at 15 feet. My station
was running about 40w PEP to a Hamstick 10m mobile magmount antenna on a
piece of sheet metal at 15 feet. Not exactly a contact between a powerhouse
station and a BBS listening post, in fact, we both had factors working
against a contact between two stations in our directions

Was this Aurora propagation on 10m?

Hi Ev

Really Cool report. Last night I received a fairly complete beacon from you
while my beam was pointing south. I think that BEACONet^31 has really wild
potential. I am having fun RXing your beacon. I have ordered a kit for PSK31
and hope to be on the air by next weekend. I will try the same stuff that
allows me to RX your beacon and see if you get bits-&-pices of my signal.

Another idea about Aurora! What about meteor mode? keep whacking the curtain
with a very short packet and see what happens?

Just a though!

It looks like the thought that we had a BEACONet snag on Au were
probably not correct. As it turns out, the 10-meter band was open for
"normal" propagation at the time. 1100km would have been a long haul
for Au as well, given the N-S separation of the two stations.

Below is a forwarded message from the 10-10 remailer, describing a
"typical" Au contact (a distance that is normally too short for Es but
too far for groundwave).

Ten meters has been terrible this weekend for propagation...lack of
returns on BEACONet have gone a long way to document that for sure.

Ev

Rendered body type: text/plain

Rich, WD4RBX suggested:
> Another idea about Aurora! What about meteor mode? keep
> whacking the curtain with a very short packet and see
> what happens?

What a fascinating idea! Let's try it for the next 24 hours and see
what we get. We may have already passed the "peak", but it may be worth
a try.

If anyone cares to try, visit http://go.to/BEACONet and follow the
instructions found on "Configuration | Burst Mode"...with one change
(for anyone in Europe who wants to try, too).

In North America:
Use the "quadrant" method of transmit timing (NE=0-14 seconds after the
minute, SE=15-29, SW=30-44, NW=45-59) as usual

In Europe:
North of 50-Degrees: transmit from 45-59 seconds after the minute
South of 50-Degrees: transmit from 30-44 seconds after the minute

This would have been a fascinating attempt to make all weekend long, but
"better late than never", I suppose. :o)

Lastly...we're talking BEACONet (on 28.128 USB AX.25)... *not*
BEACONet^31 for this. :o)

I'm powering up in burst mode in minutes and will run until tomorrow
morning.

Ev, W2EV

Hi All

I have heard a lot about 10 Meters being dead. Maybe so but not for BEACOnet.
All BEACOnet and BEACONet^31 needs (soon to happen) is a hand full of world
wide dedicated participates. Look at the opportunities to make radio history.
Just think about what forms of propagation exists and combine them into a
single mode of communication. Lets say that we have a major solar event going
on but it is not strong enough to allow propagation in the middle latitudes.
Now we have gray line DX over the pole or a fast meteor falls What's going to
happen to my beacon? I have no idea! In fact I am hoping that this evening
someone will RX my beacon via Aurora/gray line/hot rock. what's really cool
is I don't know that it cant happen so maybe Ill be the first to do it? DEAD
band? I doubt it!

If that's the beacon you received, it's not using either the grid square or the APRS Lat/Lon format.
UI-View probably didn't recognize any of the data as a position to plot.

If that is copied from the UI-View terminal window, then the format of
the beacon is neither APRS nor BEACONet compatible, so it's not going to
plot on the map in UI-View or any other software that I know of.

Rendered body type: text/plain

So far we have 7 people registered for the MS event. Good luck everyone!

- eta-Aquarids METEOR SHOWER REGISTRATION PAGE NOW OPEN -

Web Page registration is now available for those who will be participating
in the upcoming April eta-Aquarids Meteor Shower event. The purpose of
registering is to provide a real-time list of participants. This should
expedite communication and increase the chances of success. It should take
about 1 minute to register. Click on the URL below and then click on
REGISTER HERE.

http://w9if.net/cgi-bin/beaconet/main.pl

NEW WEB PAGE FEATURES:
o TX Power options coincide with the new specification.
o Antenna length options coincide with the specification.
o Antenna direction has been added and coincides with specification.
o 10 meter band has been added as an option
o If you make an error while registering, you can now register again
o Added a "Probability of Success" icon
o Web page layout significantly updated
o Added Map showing "POS", antenna direction, and antenna beamwidth

I got interested in this facet of amateur radio after reading the article
by W2EV in the Nov 99 issue of QST. I quickly realized that my chances of
success could be increased if I knew who was participating so I knew where
to point the beam. It was out of this need that I developed this
registration page. I hope that you find it useful. For those interested in
more information, the Nov 1999 QST article by W2EV and the Nov 2000 issue
of QST (page 28 and 83) may be useful.

thanks, W9IF

Rich Parry

Rendered body type: text/plain

I just purchased and am getting used to my 746. If anyone on the list is using it to do beacon work with a personal computer I would be interested in their set-up. You could respond here or send it directly to cmcmanus@kscable.com   I would like to get the beacon back on the air ASAP but would appreciate input. Thanks.

Hi Craig,
Two places to go for information:

Connecting a TNC or SoundCard to a Transceiver:
http://www.packetradio.com
You'll find a ton of information on this site. It's first class all the way.

Configuring it for BEACONet use once your computer, transceiver and TNC/SoundCard are talking:
http://go.to/BEACONet

Ask any clarifying questions to the remailer. We're happy to help.

Ev, W2EV

15. [propnet] possible 6m "hit"

From: Bruce Brackin <bbrackin@bellsouth.net>
Date: Mon, 02 Apr 2001 18:20:59 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-4490-2001.04.02-18.37.40--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Received a garbbled packet about 15:30 UTC 4/2/01 (TNC clock loses time like crazy) on 53.53. Any one on 53.53 have an "A" prefix call - got somthing like "AcPL / 8V!!85/___-15" where the '/' is non alpha/numeric and the "_" is space. The "-15' may be for omni antenna.

Any suspects?

Bruce, KD5IUG [EM42xi]

Ev - It could have been! Have been experimenting with the clock
adjustment on the 1270 and hope to get a little more accurate time
keeping.

If anyone has the magic number or formula please let me know... For now
at least I at setting it from WinPack daily and keeping notes to figure
the lag per hour as I home in on it. At least I figured out the MSTAMP!

Bruce, KD5IUG

Hi all

Just finished testing the interface for BEACOnet^31 and got (I think)a good
report from HA7VA IMD: 10 dB. All I need to do is get the software working
together and Ill be ready to play. I think Ev has the information on how to
set the software up so I will visit BEACOnet website shortly.

You've obviously got it working now, because I've just received you on
28.128 (1540 GMT). Well below the signal level that would be needed for
normal packet.

Looks like it might be an extraordinary night tonight -- I just
received the below packet on 144.39, from over 400 miles away. The first
hop is around 150 miles!

WX5II-1>APZ17,W5RP-1,W5CDM-1,KE5PL-1,K5DKC-15,KB5ZFA-14,KB5ZFA-15,WA5IHL-11*
,TRACE7:!3008.25N/09819.50W#PHG556 <LINE TRUNCATED>

WX5II-1>APZ17,W5RP-1,W5CDM-1,KE5PL-1,K5DKC-15,KB5ZFA-14,KB5ZFA-15,WA5IHL-11*
,TRACE7:!3008.25N/09819.50W#PHG556 <LINE TRUNCATED>

      One thing I don't understand, though, is the last part of the packet
-- <LINE TRUNCATED> ??? Is this from some particular software? Anybody
recognize this thing?

      7 3
      Earl

Rendered body type: text/plain

How do I adjust the TXDelay if I'm using AGWPE? I tried the old dos
program I have for that, but it didn't seem to affect anything.

      Thanks,
      Earl

AGWPE Port properties -> Tnc Commands tab -> TXDelay (the unit is 10
msec) -> restart AGWPE.

The "APZ" infers an experimental APRS station at WX5II, I think. There
is an awefully lot of info between the ">" and ":" (more than 7
"callsigns") which may have contributed to the error (conjecture...as
I'm not intimately familiar with that part of the AX.25 spec).

Maybe a quick note to the APRS list can further clarify for you, since
this is an APRS frame?

Ev

Visit http://go.to/BEACONet to get the instructions to setup your
BEACONet station. Tropo season is just starting, and the summer VHF
contest season is right around the corner.

Unlike Meteor mode, you don't need a 400-watt ERP to participate. Any
signal is a good signal...of course, more *is* better. :o)

Join in on the fun!

Ev, W2EV

p.s. -- May QST will feature and article on BEACONet. Get powered up to
greet our newly arriving fellow experimenters!

31. [propnet] BEACONet^31 thoughts -- TX length & channel load

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Sat, 07 Apr 2001 08:41:25 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-5435-2001.04.07-07.59.50--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I've been off the air for the last week, but will be returning today.
In the interim, I've given some thoughts to the whole BEACONet^31 idea
and am very excited about the prospects, but with some reservations
(which may already be addressed...I'm just not aware yet).

It takes over 15 seconds to send one transmission of:
BEACONET W2EV>HY0G02-15>[FN03XD] W2EV@ARRL.NET^XYZ21

I understand that the PSK31 unicode favors lower case letters, but I
don't know if UI-View will decode lower case letters. Roger, what say?
It would be interesting to find out how much time is saved by going all
lower case.

Even given that, and a TX every 5 minutes, it looks like having everyone
grouped around 1500 hz would allow for only a handfull of participants.
Roger' "next enhancement" of allowing decode of all stations in a
passband would solve this issue nicely as we would be seperated not only
by TX timeslot but also by audio frequency within the passband.

Then, comes a discussion of frequency for BEACONet^31...but that's in
the next message.

Ev, W2EV

32. [propnet] BEACONet^31 -- Frequency and Participation?

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Sat, 07 Apr 2001 08:45:10 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-5437-2001.04.07-08.03.39--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Two questions:

Who else is participating on BEACONet^31 (on 28.128 USB)? I have yet to
decode anyone...but I"ve been heard. Then again, I was active for only
a few days before the Flu hit my household. I'll be back on Monday.
(I'm on AX.25 BEACONet for the weekend on 28.128)

Is there any advantage to moving to 28.131, given that I expect quite an
influx of 28.128 activity over the next two months or so (QST prints a
BEACONet article next month)?

>

I finely got set up and tested the system the other day (thanks again Roger).

  Is there any advantage to moving to 28.131?
Hummm! I have been pondering something that I found happening while I was
playing with B^31. Here is the scoop.

I was using 2 ten meter rigs both on 28.128. one computer running 1 copies of
UI-View and one copy of PSKserver. UI-View with server enabled. When UI-View
said "time to send beacon." The packet beacon would start TXing then B^31
would start TXing and packet would stop. When B^31 stopped sending Packet
would fire up and send again. I think? that I was sending both packet and
B^31 BEACOnet beacons. This brings me back to your other E-mail. If B^31 can
be shortened then maybe it would work to keep both on the same frequency. If
not Then moving B^31 up to 28.131 would be fine.

I Was wondering if (now that you mentioned something similar) it would be
possible to TX and RX on say 4 audio freq and break up the beacon into 4
parts effectively cutting TX/RX time to 1 fourth using B^31. Now If there was
any advantage to using B^31 FM (DSP filter in sound card might help here)
mode maybe we would have a better meteor mode?

I might be crazy?

>   Is there a file that is used to set up the internet server list in
> UI_View32? How can I change the list of servers available?

UI-View.INI includes a secttion titled [APRS_Servers]. I'll bet that
adding the appropriate entry there will get you what you want. Of
course, that will take care of APRS, but won't do much for your
BEACONet/PropNET work. :o)

Ev

In article <LYR18754-5483-2001.04.07-14.23.03--roger#peaksys.co.uk@lists
.tapr.org>, Earl Needham <needhame@yucca.net> writes
>
>   Is there a file that is used to set up the internet server list in
>UI_View32? How can I change the list of servers available?

You can add a server to the "Select A Server" list in "APRS Server
Setup" by keying it into the text box at the top of the drop-down list.
You can remove servers from the list by selecting the server and then
pressing the Delete key.

Rendered body type: text/plain

Hello all,
I just put my 6meter station back together and am running a level II satation for the time being.
Using an Yaesu FT-870 @ 100 watts into my cushcraft 5 element beam at 40 feet pointed midway between L.A
 and New Mexico. My Beacon times are every 5 min. begining at 00:00; i.e., 4:00 4:05 etc.
I'll let this run for a while until we get closer to the actual M.E. event. I'll then switch to meteor
mode.
Anyone seeing me please respond by email.
Thanks,
Wayne,
KE6AJE

Ev, I placed an unattended station on the air here in North Texas on
147.585.   I viewed the web site and understood the info about the TO field
and got the code. What do I put in for the rest of the unprotopath, I
assume nothing. I also created a BT entry and have it set for ever 10
minutes. Is this too often or too short? The station will/should show as a
WX station.

Hi Guy,
On BEACONet, your frame should take the following form (minimally):
KC5GOI>BSNPAH-#:[EM13LE] kc5goi@kc5goi.net
       ^^^^^^^^=config code from web site (as you already found)

If you are interested in extending your range a bit through digiptating,
then add this (it will get you 2-trace n-N hops through any in-range
stations with a Network Personality of "1"):
KC5GOI>BSNPAH-#,HOP2-2:[EM13LE] kc5goi@kc5goi.net

No other icon or lat/lon information is supported on the BEACONet
service at this time. The idea is to keep transmissions as short as
possible. Honestly, if WX info or special icons are an interest, you're
better staying with 144.39 APRS where the network is built for it.

But...with the spring/summer tropo season about to open...we'd love to
have you here! :o))

We've been playing with a 5-minute ID cycle on 10-meters, which works
very well. I think that would be great for us on 147.585, too. Good
idea!

Regards,
Ev

Hi all

I have set up a minimal station for 223.780 Tropo season. If there is any
interest Ill fire it up next weekend.

Thanks
Rich

I got a UI-View icon from EA5UB today at about 17.00z he was there for
about an hour. I had the rig running all day but did not get anything
else.

John,
I got the same thing! Yet others saw south america, too. This is
fascinating stuff, for sure.
Ev

46. [propnet] eta-Aquarids METEOR SHOWER - reminder

From: Richard Parry <rparry@qualcomm.com>
Date: Sun, 08 Apr 2001 20:54:48 -0700
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-5738-2001.04.08-23.13.56--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

So far we have 9 people registered for the MS event. Good luck everyone!

- eta-Aquarids METEOR SHOWER REGISTRATION PAGE NOW OPEN -

Web Page registration is now available for those who will be participating
in the upcoming April eta-Aquarids Meteor Shower event. The purpose of
registering is to provide a real-time list of participants. This should
expedite communication and increase the chances of success. It should take
about 1 minute to register. Click on the URL below and then click on
REGISTER HERE.

http://w9if.net/cgi-bin/beaconet/main.pl

NEW WEB PAGE FEATURES:
o TX Power options coincide with the new specification.
o Antenna length options coincide with the specification.
o Antenna direction has been added and coincides with specification.
o 10 meter band has been added as an option
o If you make an error while registering, you can now register again
o Added a "Probability of Success" icon
o Web page layout significantly updated
o Added Map showing "POS", antenna direction, and antenna beamwidth

I got interested in this facet of amateur radio after reading the article
by W2EV in the Nov 99 issue of QST. I quickly realized that my chances of
success could be increased if I knew who was participating so I knew where
to point the beam. It was out of this need that I developed this
registration page. I hope that you find it useful. For those interested in
more information, the Nov 1999 QST article by W2EV and the Nov 2000 issue
of QST (page 28 and 83) may be useful.

thanks, W9IF

Hi John and Ev

I E-mailed Leonardo direct to see if he RX my beacon because I am testing the
HTX 100 and here is the response I got. He is running APRS not BEACOnet
protocal. I did not want to say anything to him in fear of running him off. I
thought that maybe you might want to take him under your wing. Also my
reception of the two stations was spotty at best.

Rich
WD4RBX

From: lu3avo@yahoo.com (Leonardo Miceli)
To: RickfordG@aol.com

<Hi Rich, my name is Leonardo and these are my first signs in APRS in 10 metres, because in Argentina it is not practised this thing yet and the less there is, it is done in VHF. I couldn´t see any station in 10 metres yet on my screen. I wish to see you soon.
Regards
Leonardo>

50. [propnet] BEACONet Active (BEACONet^31 QRX for now)

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Mon, 09 Apr 2001 16:59:20 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-5896-2001.04.09-16.17.51--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

With the impending new interest in BEACONet, I'm going to stay active on the AX.25 version for a while. It's nice to have South America active on 10-meters and with a BEACONet article in this month's QST about to hit...it seems like it's time for me to settle a bit and make sure there are signals out there for people to latch on to when they join us.

So...please join me on 28.128 USB, 53.530 FM and 147.585 FM. . . and keep having a ball!

Ev, W2EV

A s t r o A l e r t
Sun-Earth Alert

Solar Terrestrial Dispatch
http://www.spacew.com

09 April 2001

EARTH-DIRECTED CORONAL MASS EJECTION
MIDDLE LATITUDE AURORAL ACTIVITY WARNING - 11-12 APRIL

Supporting Discussion Forum:
http://www.spacew.com/aurora/forum

Real-time Discussions with Others:
http://www.spacew.com/irc

Active sunspot Region 9415 spawned a major class M7.9 solar x-ray flare at 15:34 UTC (11:34 am EDT) on 09 April. The flare was responsible for producing a minor increase in the density of energetic protons in the near-Earth space environment. This event was also associated with a high velocity coronal mass ejection (CME). The estimated velocity of the CME was determined by SOHO scientists to be travelling against the plane of the sky at near 1,086 km/sec, based on a preliminary analysis. The CME is headed, more or less, directly toward the Earth.

Forecasters anticipate this disturbance will impact the Earth's magnetosphere sometime during the early UTC day of 11 April (anytime after approximately 6 pm EDT on 10 April for North American residents or after midnight on 10/11 April for residents of Europe).

This disturbance has the potential to produce periods of moderate to

strong auroral storm activity over high and middle latitude regions. Observers interested in watching for auroral activity associated with this disturbance are urged to get outside PRIOR to local midnight on 11 and on 12 April. The near-full moon will rise shortly after local midnight and will heavily obscure any auroral activity that may be present. Prior to and near local midnight, optimally dark skies should exist for observing activity.

A middle latitude auroral activity warning has been issued for this event. Although the chances of this disturbance producing a major auroral storm event similar to what was observed on 31 March is unlikely, no one can discount the possibility that a large storm might occur. Observers are advised to plan for a large auroral display (get the camera and film ready, and prepare for an excursion to a dark-sky site), but expect something less.

Active sunspot Region 9415 remains a fairly large and magnetically complex spot group. Additional major solar flares and possible Earth-directed coronal mass ejections will remain possible into the forseeable near-future.

By way of potential interest, a comprehensive internet course on observing, interpreting and predicting solar and space weather events is being offerred to the general public (no prerequisites required). The course is comprised of over 630 pages of curriculum and includes several software packages that can be used to help provide hands-on experience. The course is a "complete it when you can" type of class. There are no time restrictions imposed for completing it. Complete details are at:
http://www.spacew.com/www/course.html

/\

MIDDLE LATITUDE AURORAL ACTIVITY WARNING

ISSUED: 02:00 UTC, 10 APRIL 2001

/\

*** POTENTIAL FOR MODERATE TO HIGH ACTIVITY EXISTS ***

VALID BEGINNING AT: 21:00 UTC ON 10 APRIL
VALID UNTIL: 19:00 UTC ON 12 APRIL

HIGH RISK PERIOD: 11 APRIL (UTC DAYS)
MODERATE RISK PERIOD: 11 - 12 APRIL

PREDICTED ACTIVITY INDICES: 12, 40, 30, 12 (10 APRIL - 13 APRIL)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE TO HIGH

POTENTIAL DURATION OF THIS ACTIVITY: MAIN BELT = 12 TO 18 HOURS
MINOR BELT = 18 TO 24 HOURS

ESTIMATED OPTIMUM OBSERVING CONDITIONS: PRIOR TO AND NEAR LOCAL MIDNIGHT

EXPECTED LUNAR INTERFERENCE: NONE PRIOR TO MIDNIGHT, HIGH AFTER MOONRISE

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR TO GOOD

AURORAL ACTIVITY *MAY* BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

SOUTHERN OREGON TO NORTHERN UTAH TO NORTHERN COLORADO TO NEBRASKA TO NORTHERN MISSOURI TO SOUTHERN ILLINOIS TO KENTUCKY TO VIRGINIA.

ACTIVITY *MAY* ALSO BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

EXTREME NORTHERN FRANCE TO CENTRAL GERMANY TO CENTRAL POLAND TO BELARUS TO NORTH-CENTRAL RUSSIA (NORTH OF A ROUGH LINE FROM SMOLENSK TO MOSCOW TO KIROV, ETC). NEW ZEALAND AND EXTREME SOUTHERN COASTAL REGIONS OF AUSTRALIA (PARTICULARLY SOUTHEAST AUSTRALIA) MAY ALSO BE ABLE TO SPOT PERIODS OF ACTIVITY.

SYNOPSIS...

A heavily Earth-directed and fairly high velocity coronal mass ejection was observed erupting from the Sun today in association with a major class M7.9 solar x-ray flare at 15:34 UTC on 09 April. Confidence is high that this disturbance will impact the Earth. However, most forecasters do not believe it will produce as strong an auroral storm as was observed on 31 March (when activity was observed into the low latitude regions of the Gulf coast states

and Mexico over North America). The realistic picture is for a minor to major auroral storm capable of producing fairly widespread observations of activity from many middle latitude regions. But activity as grand as was observed on 31 March is unlikely to occur with this disturbance. Nevertheless, no one will know for certain what will happen until after the disturbance reaches the Earth. Therefore, caution is advised. Plan for a big display but expect something less.

Impact of this disturbance is expected to occur sometime during the early UTC day of 11 April. North American observers may be lucky enough to spot the initial impact after darkness falls and before the moon rises. However, the window of opportunity is small. New Zealand and Australian observers may be the best positioned witness the main stormy phase of this disturbance (as well as Northern Russia). European observers may also be well positioned, particularly if the arrival of this disturbance occurs during the mid to latter part of the UTC day of 11 April.

Observers are encouraged to watch the skies during the nights of 11 and 12 April for possible activity. Moonrise occurs near local midnight over most regions on these dates. As a result, optimal observing conditions will occur after the sun sets and before the moon rises. The near-full phase of the rising moon will heavily drown out the fainter signatures of auroral activity.

Additional Earth-directed coronal mass ejections are possible over the next several days.

This warning will remain in effect until 19:00 UTC on 12 April. It will then be updated or allowed to expire.

52. [propnet] AstroAlert: News from VSNET

From: Makoto Uemura <uemura@kusastro.kyoto-u.ac.jp> (by way of Earl Needham <needhame@yucca.net>)
Date: Tue, 10 Apr 2001 16:13:20 -0600
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-6128-2001.04.10-18.02.32--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

*** News from VSNET ***

The SU UMa type dwarf nova TU Crt is now undergoing a relatively
rare superoutburst.

For more detail information about these objects,
see below, "VSNET Weekly Campaign Summary" of the last week.

VSNET (Variable Star Network) is an international variable star observing network, covering various areas of novae, supernovae, cataclysmic variables (CVs), X-ray transients, and other classical eruptive, pulsating, and eclipsing variables. VSNET is one of invited contributing organizations to the SkyPub AstroAlert system.

The "News from VSNET", mainly focusing on recent remarkable activities of CVs and related systems, is issued on a weekly basis, except on occasions of extremely urgent or transient events.

Please refer to the VSNET Home Page for more details of events and objects listed.

VSNET Home Page: http://www.kusastro.kyoto-u.ac.jp/vsnet/

VSNET provides a number of mailing lists, on which various news and topics are discussed. Subscriptions to the VSNET mailing lists are free of charge; please refer to the instruction on the above page if a reader needs more information of the list structure.

CCD observations of such targets are a relatively easy task for a 20-40cm telescope; simply take as many CCD frames (with exposure times 10-30 sec) as possible, spanning several hours per night. The only requirements are the weather and your patience! If you need more help on the observing technique, please feel free to ask on the vsnet-campaign list.

We would sincerely appreciate volunteers who would join the VSNET Collaboration team to study the wonders of these exotic variable stars. To join the VSNET campaign collaborative list, send an e-mail to

vsnet-adm@kusastro.kyoto-u.ac.jp (VSNET administrator)

with a line "SUBSCRIBE vsnet-campaign."
(VSNET campaign members are strongly recommended to subscribe to vsnet-alert at the same time).

Regards,
Taichi Kato
On behalf of the VSNET administrator team

The following was issued on Apr. 10, 2001, as VSNET campaign circulation 841.
[Note a large part of detailed information is posted to vsnet-campaign sub-lists].

VSNET Weekly Campaign Summary

*** Last week news ***

(new targets)

RX J0558.3+6753 (RA = 05h58m18s.0, Dec = +67o53'46")

As reported on April 3 by T. Kinnunen, the ROSAT-selected CV RX J0558.3+6753 experienced an outburst at 14.0mag. This observations seems to confirm the dwarf nova nature (vsnet-campaign 837). A. Oksanen reported B=15.66, V=16.03, and R=15.84 on April 5 (vsnet-campaign-dn 627). The outburst seems to be a normal one (vsnet-campaign-dn 620).

TU Crt (RA = 11h03m36s.50, Dec = -21d37'45".6)

P. Nelson reported that the SU UMa-type dwarf nova TU Crt is undergoing one of is relatively rare outbursts. The brightness (12.2mag) may suggest a superoutburst. The last superoutburst occurred in 1998 March, when the first-time superhumps were detected (vsnet-campaign 840). The superoutburst continues (vsnet-campaign-dn 631).

VV Pup (RA = 08h15m06s.73, Dec = -19d03'16".8)

The VSNET administrator team has received a request from FUSE team to ask VSNET team to observe VV Pup (polar) on April 5 and 6,

in order to know the current activity state during the FUSE observation. This system has a 100 min orbital period and a large hump when the pole is in view if it is in an active state (vsnet-campaign 838). The Kyoto team performed an observation on April 5 (vsnet-campaign 839).

(continuous targets)

V485 Cen (RA = 12h57m23s.30, Dec = -33d12'06".8)

The superoutburst continues (vsnet-campaign-dn 619).

Z Cha (RA = 08h07m16s.29, Dec = -76d32'20".9)

The fading from the superoutburst was reported (vsnet-campaign-dn 622, 632).

V1504 Cyg (RA = 19h28m55.87s, Dec = +43d05'39".9)

The superoutburst continues (vsnet-campaign-dn 626).

Delta Sco (RA = 16h00m19s.9, Dec = -22d37'17")

Delta Sco is still bright at about 1.8mag (vsnet-campaign-be 96).

W Com (RA = 12h21m31.5s, Dec = +28d13m57.6s)

The activity was still seen during the last week (vsnet-campaign-blazar 173).

V4643 Sgr (RA = 17h54m40s.43, Dec = -26d14'15".7)

The object is now in a gradually fading phase and the current (April 4) magnitude is reported to be about 13.8 (vsnet-campaign-nova 278).

V803 Cen (RA = 13h23m44.5s, Dec = -41d44'30".1)

The strong activity still continues (vsnet-campaign-dn 623).

V893 Sco (RA = 16h14m45.26s, Dec = -28d39m30.3s)

The outburst was faded (vsnet-campaign-dn 625).

MKN 421 (RA = 11h04m27s, Dec = +38d12'32")

The activity around ~12.8mag is still continues (vsnet-campaign-blazar 174).

3C 279 (RA = 12h56m11s.1, Dec = -05d47'20")

The current magnitude is about R=14.8 (vsnet-campaign-blazar 176). M. Villata reported 3C 279 is sensibly rising on April 9 (vsnet-campaign-blazar 175).

*** Future schedule ***

Message-ID: <LYR1548-6363-2001.04.11-21.10.39--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm looking for someone to try out and give me some feedback on a prototype
propnet data warehouse. This would be a repository where we can look at
historical propagation logs. And maybe learn something!

I'm looking for someone who has
- a PC and is running Windows 95 or newer
- Running Internet Explorer Browser, version 5.0 or newer
- And you have an internet connection that is better than a dial up modem
(DSL, or Cable modem is fine).

No experience with data warehousing is needed!

Please respond to me off-list.

Rendered body type: text/plain

I've been hedging making this announcement because I'm afraid that the timing stinks. QST is about to be delivered with an article on BEACONet, and it is *very* important that we all power up to provide our newly arriving interested folks signals to hear...so please promise that you'll come back to 147.585-MHz during non ISS passes...please? :o)

It appears as though there is a digipeater in space, and BEACONet protocols work wonderfully though it! Best of all...use of the ISS' digipeater requires minimal equipment! (can you tell that I'm excited?)

How to participate:
Setup your transceiver as follows...
TX Frequency: 145.990 FM @ 1200 baud
RX Frequency: 145.800 FM @ 1200 baud

Setup UI-View to transmit a standard BEACONet frame (just like you are already doing on 147.585 MHz), but do so with a beacon interval of 0.5 minutes (that's 30-seconds, by the way) :o)

When the ISS is over the center of the USA, it is possible to "see" from coast-to-coast! Icons of any participant will appear on your screen (just like what happens when the band opens).

I cannot take credit for putting a digi on the ISS, but I can sure use it! Here's an excellent opportunity for anyone with 5 to 50 watts and a simple vertical antenna to be heard, nationally!

Have you been a lurker for lack of RF output? Here's your chance to spread your BEACONet wings!

To play on the ISS, you need to make one subtle change to your UI-View configuration...right after you enter your Configuration Code, enter the word "NOCALL" (as in NoCall). You will transmit frames that look like this:

W2EV>VK1E22-10,NOCALL:[FN03XD] w2ev@arrl.net

"NOCALL" is the "name" of the digipeater on the ISS. By including this statement, you are asking for the ISS to repeat your frame from 400 km in the sky! (this is the same place that some of us put "HOP2-2"...but don't put HOP2-2 in your frame on this frequency...that will gunk up the channel)

In the USA...the ISS passes overhead from about 8:00 pm (eastern) until about 2:00 am (eastern), every hour and a half or so. These are all *very* rough times...but if you setup to try...this is the best window of opportunity at this time. More information on passes can be had at: http://www.heavens-above.com

One last note...if you participate...you'll see some goofy icons appear on your screen. That's because the APRS folks are playing on the ISS, too. They're using a much less efficient (longer) frame that includes icon designation and full lat/lon. There's room for both of us...but with the more efficient BEACONet protocol...we'll probably be heard better (and more often).

The ISS can be a perfect training ground for anyone wanting to become familiar with BEACONet. Join us...we're having a ball!

Ev, W2EV

Hi All

I had a nice but short chat with Leonardo (LU3AVO) today on 28.128. He was
running 80 watts to a 4 element beam. I had to switch to my beam at the end.
I was running about 20 watts. He will be on again tomorrow at about 22:00 UTC
(6:00 PM Eastern) Fire up, I am the only station he is RXing.

Rich

Rich,
That's great! Unfortunately...lightning took my 10-meter station out
last night. The output curcuit is crispy. :o(I'm in the process of
rebuilding tonight. Great timing. sigh.

Hey folks, join-in on the fun. Rich and Leonardo would love to have you
on board! ;-)

Rendered body type: text/plain

Hi All,
I tried using UIVIEW on the ISS pass tonight. I got one station, N8QLT, to print a grid square in UIVIEW. Here is the station info:

22:40:51R N8QLT>VK1H23-2,NOCALL* <UI C Len=17>:
[EN82HL] {UIV23}

Whow, finaly a way for me to do this from the west coast! Great fun! I am going to wait up tonight and try for the next pass.

I did not get any contacts with my other setup using APRS (running simultainiously). Does anyone know where to get info on how this is to be done with APRS software?

Anyone see me?

Thanks,
Wayne, 73

Rendered body type: text/plain

WinAPRS is totally useless for either ISS or BEACONet work (anything other than a straight CQ in the To-field confuses it). APRSdos requires that you "turn To-call 'other' wildcard on" in order to decode BEACONet (and any other) frames properly (CONTROLS-FILTERS-OTHER to ON).

By the way...this same process is required if one uses APRSdos for 24/7 BEACONet operation.

Congrats Rich (N8QLT) on being the first BEACONet station to be reported via ISS! The APRS folks are playing, too...but they are doing so with very little coordination as to transmit format, making things a bit difficult to analyze.

For instance...some of them are transmitting frames that look like this:
CALL>CQ,NOCALL:

Nice, short, useless to analyze (no location info)...but fine for keyboard to keyboard communication (if you can get more than one or two frames through the ISS digi).

For a "brute force" method...try a TNC only (no UI-View) and turn PASSALL ON. This will display even "munged" packets on your screen. You may be able to visually decode other callsigns (and folks using an otherwise non-decodable packet frame format) in there, too. We are only one of three distinct communities using the bird: BEACONet, APRS and general packet users with knowledge of neither.

I'm sure that the ISS is being pounded with tons of signals from the ground right now. Even a fleeting success is a good success! As things calm down, we can experiment a bit more.

Join us, folks...we're having a BALL!

Rendered body type: text/plain

Hi folks,

I was doing the BeacoNet thing last night with the ISS for 4 or 5 passes, and had about 17 stations show up on my map. Many more stations were participating, however, these other stations neglect to place a grid square or position in their beacon, or the grid square is badly formed.

I saw Ev pop up on one of the last passes, too!

The most distant station I heard via ISS was over 1600 miles west of me, so this does cover nearly all of the country. Below is my station list:

2001-April-13 07:56 17 stations times are EDT

Callsign	Type	Latitude	Longitude	Miles	Bearing	Last Heard
VE7KPB*	Home	49.30.28N	115.46.91W	1620.0	299	Apr 12 20:52

Setup UI-View to transmit ...
with a beacon interval of 0.5 minutes

Ed, N9AWP replies:

With all the excitement about the ISS'
DIGI there are many packet frames being,
to paraphrase EV, blasted into the ether
on 145.990 Mc. during a pass.

My humble opinion is if everyone
transmits a UI frame every 30
seconds it will only congest the already
congested uplink no matter how efficient
the packet.

PLEASE don't take this wrong! I am all for
all operations of packet radio.

It would be interesting (for me) to read some
speculation/observations of propagation via
the different phenomena known and unknown.
The post on this reflector are full of interesting
and valuable information.

On another note, I would enjoy the reflector
posts more if I didn't have to scroll through
the HTML and unedited *quote replies*.

Ev,
It was quit busy out here last night on this freq. I fotgot to report the
distance info on this one way. 2066.1 miles!
Iam hooked! Can't wait for QST article to appear to see how the bay area
locals will respond. This is a ball.
Thanks,
Wayne, 73

67. [propnet] ISS/BEACONet: Lets Experiment

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Fri, 13 Apr 2001 10:56:41 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-6672-2001.04.13-10.15.26--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I haven't gotten my QST yet...so let's play on the ISS for a couple of
more days, shall we?

There is a loooong drawn out discussion going on right now on the APRS
listserves about just what should and should not be done through the
ISS.

I would suggest that the BEACONet community do what it does best...
prove that we can work collaboratively and add to the state of the
knowedge-art.

Here's what I would like to propose:
* Everyone setup their computer for UTC time (*important!*)
* Everyone setup for 10-watts of output
* Each of us choose a different beacon interval (each value is
  important to test):
  - .5 minute
  - 1 minute
  - 1.5 minute
  - 2 minute
* Everyone enable logging
* Everyone run for a single 24-hour period, then stop
* Everyone send their log to me
I'll align all of the logs for viewing (who heard who and when).

There will then be two major variables remaining: Antenna gain and
direction-vector. These would be eliminated, if we could all find a
vertical dipole to use (or even a 5/8 wave with a little gain).

What say? Can we pick a day in the not-too-distant future and run for
24-hours, starting at some common time (like 12:00 UTC or something like
it)?

I'd like to know how much interest there is in trying this. Please send
a note to the listserve announcing your participation, and the beaconing

interval that you've chosen (so we don't have too many people choosing
the same number).

Ev, W2EV

69. [propnet] BEACONet/ISS experiment -- more thoughts

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Fri, 13 Apr 2001 13:31:14 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-6707-2001.04.13-12.50.11--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

First, some quick "housekeeping"...

If you are presently playing on the ISS, please reduce your TX cycle to
either 1, 2 or 3-minutes, please. Also...there is no need to run a ton
of power. Let's see what we can accomplish with 10-watts, if possible.
Just be sure to update your Configuration Code accordingly.

Back to our regularly scheduled program...

I've been putting together thoughts on the proposed experiment a bit.
Here they are...

(all of this is still very loosey-goosey, but it's a start)...all
participants (in the experiment) configure their systems similarly
(those not in the experiment, continue to do what they are doing...that
will be the the "background noise" from the experiment's perspective):

* Use special software that time-stamps each RX (yes...ui-view)
* Set computer time to UTC (important)
* 10-watts RF output
* Vertical dipole (or 5/8 wave), but nothing with much gain
* Configure the frame with meaningful information
* Choose a TX time of either (all of which are nominal values up for

```
  further discussion):
  - 60-seconds (up to 14 TX's in a 12-minute pass, but 12 likely)
  - 120-seconds (up to 8 TX's in a 12-minute pass, but  6 likely)
  - 180-seconds (up to 6 TX's in a 12-minute pass, but  4 likely)
  This should be coordinated to assure that everyone doesn't end
  up landing on one or two at the exclusion of the other.
* Open a logfile
* Operate for a single 24-hour cycle and stop.
* Forward logs to me for aligning them to study (with the intent
  being to post the aligned data for others to view and discuss
  and discuss and discuss) <g>
* After observing the results, suggest modifications to the
  experiment and try again in the future.

Are there other facets of the system that may need consideration?  Input
anyone?

Ev, W2EV

70. [propnet] ISS/TransAtlantic?

```
From: Ev Tupis <w2ev@rochester.rr.com>
Date: Fri, 13 Apr 2001 13:55:51 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-6721-2001.04.13-13.15.23--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain
```

```
I just floated this message to some folks in Europe.  I appologize if
the formatting gets goofed up, but read through it...especially if you
are in New England or the maritime provinces of Canada.  This *can* be
done!

Ev, W2EV

There appears to be an opportunity building for a transatlantic attempt
today (in about three hours or so from now, and again on the next
orbit).  I don't have any software to do the plotting, so I'm relying on
what I see here:
http://spaceflight.nasa.gov/realdata/tracking/index.html

If anyone (especially in Ireland) is interested, and has a beam to point
into the Atlantic, I'll be aiming your way, too.  Let's see what we get!

Ev, W2EV

Background information below...

According to page 23-5, 16th edition of the ARRL Antenna handbook, the
distance(in kms) to the horizon from an antenna of H meters height is
4.124 times the square root of the antenna height in meters.

This is a *radius* value for an orbiting object.  Draw a circle around
it with that radius to see who is "in range" of the digipeater.

At it's lowest, the ISS is 378km high, which equates to a 2,535.51 km
radius (approx. 5,070 km diameter).  At it's highest, the ISS is 395km
high, which equates to a radius of 2591.81 km (approx. 5,183 km
diameter).

So far, the longest recorded DX (to my knowledge) is W2EV (New York) to
N6NU (California) at 3,760 km.

The distance from the UK to the upper Atlantic USA is approximately
5,000 kilometers!  Is anyone else thinking what I'm thinking? :o)

```

Hello Ev and the rest. This is some what directed to wards an answet to
Ev's post of a 1 day mass attempt at a coordinated test. Also, I'm very
interested but not up and running but a very avid ad interested lurker
here. Any way. Since every body is using an underlying computer to power
the systems could the option of selecting the beaconing interval not be
taken a step further. Go with a basic 10 min. sequence but set up the
starts by states at 6 second intervals. Wouldn't that give an additional
piece of info if a given packet came through courupted ? I hope that the
idea is clear and that it wouldn't be to difficult to implement if
practical.

Rendered body type: text/plain

Hi Mike,
This isn't a lame suggestion at all. That's what I love about the
BEACONet community...we can feel free to express ideas...'cause it's all
a collaborative experiment. :o)

Here's some information that may help to further focus your suggestion:
The reduced beacon rates are in relationship only to ISS (International
Space Station) operation...not 24/7 BEACONet operation. A pass is
12-minutes (or so), maximum. That's why we opened the discussion about
reducing the beacon interval...to see what auto-beacon rate would get us
heard, while not doing it so much as to saturate the TNC on the ISS (and
block it from being used by other users).

Does that change anything about your suggestion at all?

To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-6759-2001.04.13-16.48.07--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all
Looks like BEACOnet has a chance to try (you cant do that It won't work) to
make history. Anyone want to try bombard the Aurora curtain with packet and
see what happens? If so fire up meteor mode later today (sunset) and tell us
what band. I am thinking 28.128 what you think? Lets hurry up and get
coordinated!
Rich
WD4RBX
EM84NM

AURORA ALERT: An interplanetary shock wave struck Earth's magnetosphere
early on Friday the 13th and triggered a strong geomagnetic storm.
Forecasters anticipate that a second shock wave will arrive later Friday
or Saturday, possibly intensifying the ongoing disturbance.
Middle-latitude sky watchers should remain alert for auroras after local
sunset.

AURORA GALLERY: A pair of coronal mass ejections that hit Earth's
magnetosphere on April 11th sparked an intense display of auroras. Sky
watchers in the United States saw "Northern Lights" as far south as the
New Mexico-Texas border. Check out our aurora gallery for more than 50
images of the storm.

(Hope Ev doesn't mind me replying.)

1. With the focus on the UI-View map window, press Alt+PrintScreen, that
copies it to the clipboard.

2. Open Paint, or some other graphics utility, and use Paste to paste
the UI-View screen into an image.

3. Save it.

Hi Ev, I don't think any thing changes. With the time constraints of 10-12
mins that fits and I would guess that a some what central pass would cover a
majority of the states (I'm guessing this from your earlier post about the
trans-atlantic footprint that the ISS would see. I think it would result in an
additional possible piece of info. We have the capability to date stamp the
packet and if all are adhearing to the same plan a partial packet could be
closer reconstructed by the "state" 6 second time.
I hope.

And as I still don't have a setup I'm going to at least tune my H/T to the
downlink freq and listen for any squawks.

Mike

A s t r o A l e r t
Sun-Earth Alert

Solar Terrestrial Dispatch
http://www.spacew.com

12 April 2001

MAJOR X-CLASS SOLAR FLARE ALERT
MIDDLE LATITUDE AURORAL ACTIVITY WARNING

Supporting Discussion Forum:
http://www.spacew.com/aurora/forum

Real-time Discussions with Others:
http://www.spacew.com/irc

A major class X2.0 solar flare erupted from active sunspot Region 9415 on 12 April at 10:28 UTC (12:28 pm EDT). This flare was associated with another full halo (Earthward-directed) coronal mass ejection (CME). This was preceded on 11 April by a minor solar flare that also produced an Earthward-directed coronal mass ejection.

The first CME to impact the Earth is expected to be from the minor solar flare that occurred on 11 April and it should arrive sometime during the late UTC hours of 13 April or early in the UTC day of 14 April (anytime after 18:00 UTC or 2 pm EDT) . The second coronal mass ejection from the X-class flare of 12 April should be somewhat stronger and should arrive late on 14 April or early on 15 April (UTC time).

Either (or both) of these events have the potential to produce periods of moderate to strong auroral activity. The moon's waning phase and later rise-times should permit longer periods of observations under less light polluted conditions, even into the early morning hours for most regions.

Observers should not underestimate the potential for possible strong levels of auroral storming late on 13 through 15 April. The last major disturbance (on 11 April) produced strong levels of auroral activity that became visible well into central Europe. Unfortunately, the disturbance subsided as North America became dark. Nevertheless, many areas of the east-coast of the United States spotted strong levels of activity as well. Similar conditions are expected during either (or perhaps both) of these events.

North American observers are encouraged to get out and look for activity during the evening/morning hours of 13/14 April and again on 14/15 April. The activity on 14/15 April may be the strongest.

A copy of the middle latitude auroral activity warning associated with this disturbance is appended below:

/\

MIDDLE LATITUDE AURORAL ACTIVITY WARNING

ISSUED: 05:10 UTC, 13 APRIL 2001

/\

*** POTENTIAL FOR MODERATE TO HIGH ACTIVITY EXISTS ***

VALID BEGINNING AT: 18:00 UTC ON 13 APRIL
VALID UNTIL: 19:00 UTC ON 16 APRIL

HIGH RISK PERIOD: 14 - 15 APRIL (UTC DAYS)
MODERATE RISK PERIOD: 13 - 16 APRIL

PREDICTED ACTIVITY INDICES: 15, 40, 50, 20 (13 APRIL - 16 APRIL)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE TO HIGH

POTENTIAL DURATION OF THIS ACTIVITY: MAIN BELT = 2 BELTS OF ~ 12-18 HOURS EACH
MINOR BELT = 48 HOURS

ESTIMATED OPTIMUM OBSERVING CONDITIONS: PRIOR TO AND NEAR LOCAL MIDNIGHT

EXPECTED LUNAR INTERFERENCE: NONE PRIOR TO MOONRISE, MODERATE AFTER MOONRISE

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR TO GOOD

AURORAL ACTIVITY *MAY* BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

NORTHERN TO POSSIBLY CENTRAL CALIFORNIA TO NEVADA TO NORTHERN ARIZONA TO NEW MEXICO TO NORTHERN TEXAS TO OKLAHOMA TO SOUTHERN ARKANSAS TO MISSISSIPPI TO ALABAMA TO GEORGIA TO SOUTH CAROLINA (*IF* AND *ONLY IF* FAVORABLE SOLAR WIND CONDITIONS DEVELOP OVER NORTH AMERICA PRIOR TO MOONRISE). A MORE REALISTIC EXPECTATION MAY BE A LINE ROUGHLY NORTH OF OREGON TO SOUTHERN IDAHO TO SOUTHERN WYOMING TO NEBRASKA TO IOWA TO ILLINOIS TO INDIANA TO KENTUCKY TO WEST VERGINIA TO CENTRAL VIRGINIA.

(This is the same line used in the last warning - it is valid for this event.)

ACTIVITY *MAY* ALSO BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

NORTHERN SPAIN TO SOUTHERN FRANCE TO NORTHERN ITALY TO SLOVENIA TO NORTHERN CROATIA TO NORTHERN YUGOSLAVIA TO ROMANIA TO SOUTHERN UKRAINE TO SOUTH-WESTERN RUSSIA APPROXIMATELY NORTH OF A LINE FROM VORONEZH TO SARANSK TO KAZAN TO PERM AND EAST-CENTRAL RUSSIA (*IF* AND *ONLY IF* FAVORABLE SOLAR WIND CONDITIONS DEVELOP OVER EUROPE AND RUSSIA PRIOR TO MOONRISE). A MORE REALISTIC EXPECTATION MAY BE A LINE ROUGHLY NORTH OF NORTHERN FRANCE TO CENTRAL GERMANY TO SOUTH-CENTRAL POLAND TO SOUTHERN BELARUS TO SOUTH OF MOSCOW TO KIROV TO OTHER NORTHERN TO NORTH-CENTRAL RUSSIAN REGIONS.

(This is the same line used in the last warning - it is valid for this event.)

SYNOPSIS...

Two additional Earthward-directed coronal mass ejections (CMEs) have been observed during the last 24 hours. The first CME is expected to impact sometime late on 13 April or early on 14 April (UTC days). The second and potentially larger CME is expected to arrive late on 14 April or early on 15 April (again, UTC time). Either (or both) of these events have the potential to produce periods of moderate to strong auroral storming.

Observers are encouraged to watch for activity on these dates. For North American observers, best opportunities will be during the evening/morning hours of 13/14 April and again during the evening/morning hours of 14/15 April. This latter period (14/15 April) could see the strongest auroral storming. However, either disturbances should be capable of producing storm levels of auroral activity that may be visible well into the middle latitude regions of portions of the Earth.

The waning phase of the moon will improve the visibility and duration of dark-sky observations during these dates. Observations prior to midnight or shortly thereafter should produce the most impressive sites of any visible activity.

The active sunspot region that has been responsible for the deluge of auroral storming over the last several days is moving out of position and will become much less capable of producing Earth-directed CME impacts as it begins to approach the western limb of the Sun in the coming days.

This warning will remain in effect until 19:00 UTC on 16 April. It will then be updated or allowed to expire.

80. [propnet] ISS results

From: "Wayne Colliander" <wcolliander@earthlink.net>
Date: Fri, 13 Apr 2001 17:33:39 -0700
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-6793-2001.04.13-19.51.20--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi All,
Attached are the latest results from here using the ISS. I am sure N7SFI isn't at the north pole, ha,ha. Not really 7944 miles, but don't know from where!
My station is using only 10 watts output with an omni at about 30 ft., beacon once every 60 sec, as not too much traffic here this time.
Wayne, 73

81. [propnet] [cq-l] Aurora Alert 4/13/01

From: W2VU@aol.com (by way of Earl Needham <needhame@yucca.net>)
Date: Fri, 13 Apr 2001 17:51:03 -0600
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-6796-2001.04.13-20.00.15--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The following is from SpaceWeather.com:

AURORA ALERT: An interplanetary shock wave struck Earth's magnetosphere
early on Friday the 13th and triggered a strong geomagnetic storm.
Forecasters anticipate that a second shock wave will arrive later Friday
or Saturday, possibly intensifying the ongoing disturbance.
Middle-latitude sky watchers should remain alert for auroras after local
sunset.

From CQ:
Radio effects from magnetic storms and aurora can include degraded conditions to complete blackouts on HF bands and enhanced communications on VHF and UHF bands. If the HF bands go away and you have access to VHF or UHF SSB/CW equipment, point your antenna north and listen for the watery, wavery sound of signals bouncing off the auroral curtain. While some people have had success with SSB during a strong Au opening, there is often considerable distortion and CW is generally the preferred mode. Expect the CW to be toneless at times. General exchange is callsign and signal report. Grid square is optional and can be determined later. Some ops feel grid square exchanges during openings such as these waste time and prevent others from making contacts.

Happy holidays to all.

73,
The editors

Thanks Roger! I was away last night and am just now catching up on my
mail. It's nice to know that there's such good help available to
folks. The only thing that I'd add is that, when you save the file, do
so in .JPG format, rather than .BMP. It is *much* smaller in size and
loses very little in the compression.

Regards,
Ev

A 10 minute beacon time would allow you a maximum of two attempts
through the ISS (but more than likely only one). That's not bad,
actually, as the "right mix" of TX interval for automatic beacons has
yet to be established.

I would suggest that, when you power up...you run the experiment. Set
your beacon interval to 10 minutes and let things run. Watch the
results and report back to us. Pay attention to the number of
successful decodes you had from other stations, and the number of times
that you copied your own ISS-digipeated signal.

This information can prove quite valuable to the entire community.

Regards,
Ev, W2EV

Hi Ev,
Yes, please do.
I don't understand how to check my success at getting repeated through the
ISS. My own station does not have an "*" next to my call sign! How is this
cheched for.
Sorry for the big file, won't do that again.
Thanks,
Wayne

> Just be sure to update your Configuration Code accordingly.

I will be running BeacoNet via ISS with the following settings:

UI-View 2.36
5 watts output to J-Pole (VK1C03-15) at 20 feet
Beacon interval of 2 minutes

Here's some comments I posted to the UI-View list:-

If you leave your latitude and longitude blank in Station Setup, but put
a grid square enclosed in "[]" and optional comment in the Beacon
comment field, then UI-View will send that as your posit. It's short, it
contains no unnecessary information, and it's meaningful to non-APRS
users.

So for digipeating via ISS in its current state, something like this
should work well:-

Latitude: <blank>
Longitude: <blank>
Unproto address: CQ,NOCALL
Beacon comment: [IO92XX] Boston UK
UI-View Tag: not checked

I would recommend sending the posit manually by pressing F9 rather than
sending it on the timer.

The only other thing I would add is to open the Terminal window, because
you'll see a lot of traffic that won't be decoded as APRS frames. When
you've got the Terminal window open, if you put the focus back on the
map window by clicking on it, you can still use F9 to send your posit.

I really like this...I'm following suite. 5-watts (but a 4-element
beam) and a beacon interval of 2-minutes (for me, VK1C22-9). Any Alaska
active?

The above is no longer supported in the APRSpec, which is why it
probably didn't plot in UI-View (it has been "obsolete" for two years
now)...but appears to be remnant code in WinAPRS to handle it.

For the record...this is an "original" BEACONet format that Earl and I
played with early on in the development of the BEACONet system. Then
was abandoned because WinAPRS had other problems. Then Roger's UI-View
came along (and the crowd applauded!).

The ISS/ARISS packet system is in use by a community that is much larger
than BEACONet...it includes APRS and "others". Until things settle
down, there is anarchy in how folks are launching packets.

As such...the "best" was to assure that you see everything that your TNC
has decoded is to open a terminal window and view those frames that were
received but not displayed on the map (because of being sent in a unique
format, etc.). Alternatively, open a log file, and examine it later.

Food for thought,
Ev, W2EV

      Another way to do this (and the one that I use! <G>) is run AGWPE,
then UI-View32 for the current format, and ALSO run WinAPRS to grab the
older formats.

      Although UI-View32 is the best for transmitting data, it won't put
stations in the stations list unless it receives a "plottable" packet from
them. WinAPRS, OTOH, plots old-style packets which was my first inkling of
receiving VE3EYR last night. Only trouble is that WinAPRS will NOT plot
packets with an UNPROTO-TO address of, say, VK1E02-15.

      More musings, I guess...

Those of you who are also on the APRSSIG will know that I just bought
one of the USB->Serial convertors sold by Purple computing. It's a neat
gadget!

      Using my GPS in the house, to keep my computer clock accurate enough
for meteor scatter work, I just had a thought --

      Roger, would you (pretty please) consider adding, to UI-View, some
sort of indicator that the GPS data is flowing? I have noticed that I can
turn the GPS completely off, and nothing appears to change. There's no way
of knowing whether the data is getting into the machine or not.

      Thanks,
      Earl

You can open the Show GPS Input window and see the data.

Yes. Assuming that the Configuration Code reflects your station
parameters correctly. Don't forget that NOCALL is "N[Oh]CALL", not
"N[zero]CALL".

Rendered body type: text/plain

A s t r o A l e r t

Sun-Earth Alert

Solar Terrestrial Dispatch
http://www.spacew.com

15 April 2001

MAJOR CLASS X14 SOLAR FLARE ALERT

The second largest solar flare this solar cycle (possibly the largest), a class X14 x-ray flare (possibly larger), was observed from departing active sunspot Region 9415 today at 13:49 UTC. Region 9415, which will be known as one of the super-power regions of solar cycle 23, is rotating beyond the west limb of the Sun. The activity and morphological structure of this region will undoubtably be the subject of intense study and scientific interest for years to come. It is, in a way, a fitting end to have this region produce such an intense solar x-ray flare within hours of its passage behind the west limb of the Sun. However, the effects of this most recent major flare may well be observed for several more days.

This event was associated with exceptionally loud radio bursts. It also produced a prompt and spectrally hard proton event in the near-Earth space environment. This event produced protons with sufficient energy to punch through the Earth's polar ionosphere and produce an enhancement in ground-level neutron counts at the Thule, Greenland station. Although this increased radiation poses no threat to humans on the surface of the Earth, astronauts may have been required to take radiation avoidance measures. Spacecraft may also experience increased incidences of anomalous events such as single event upsets, phantom commands, star-tracker problems, etc.

Space weather analysts are currently looking at the x-ray data from this flare. It is possible this flare (which at an X14 level would probably rank among the top 4 of the largest x-ray flares in recorded history) may have even been larger than that. There is a rumour floating around the professional community that suggests this flare may have been even larger than the estimated X22 flare earlier this month from departed active Region 9393. Once all of the x-ray data has been fully analyzed, it will be more possible to determine (quantitatively) where this flare ranks in history.

This major flare may have produced a coronal mass ejection that could conceivably result in a minor impact on geomagnetic and auroral activity on or near 18 April. Although additional analysis will be performed over the next 24 hours to better ascertain the particulars, the likelihood of this event producing a major impact on auroral activity is relatively small given the very poor location of the flare on the west limb of the Sun. Most (perhaps virtually all) of the ejected mass would have been ejected far to the west of the Earth. The region has been in decay for several days now. Although there is the possibility we may observe another major flare over the next 24 to 48 hours before x-rays from this region are completely occulted by the Sun's disk, there is also a possibility this major flare may have been the last that this region will produce. Many forecasters do not expect the

region will survive the two weeks it will take it to travel around the
backside of the Sun and back into view on the eastern limb.

      Over the next several days, the remnants of old active Region 9393
(which was a naked-eye sunspot group arguably [see above] responsible for the
largest x-ray flare [an X22 flare event] of this solar cycle) are due to
rotate back into view around the east limb of the Sun. Although we do not
expect anything very substantial to return, it will nonetheless be
interesting to examine the remnants of this once powerful active sunspot
group.

      There are no other sunspots currently visible on the solar disk that
have a significant potential to produce major solar flares.

To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-7297-2001.04.16-17.59.06--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I wanted to remind folks to expect a BEACONet feature in this months'
QST. It has been mailed. If you've been playing on the ISS, then
please start thinking about QSYing to 147.585 FM simplex so that other
newly interested folks will have a signals to hear when the band opens.

I've still not received mine in the mail...so we still have a few days.
But start thinking about coming back to terrestrial modes soon, would
you?

By the way...if someone receives their copy of QST soon, would you
please let us know? This would be a great "heads up" for everyone.

Regards,
Ev, W2EV

108. [propnet] Multiple Configurations of the same UI-View

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Mon, 16 Apr 2001 18:49:49 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-7298-2001.04.16-18.08.35--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

This is a message that came from the author of UI-View. Roger came up
with this as a result of folks that use UI-View32 for multiple purposes:

* BEACONet (on 28.128 USB, 53.530 FM, 147.585 FM)
* BEACONet^31 (which uses a slightly different configuration because
               digipeating is not supported)
* BEACONet-ISS (144.99up/144.80dwn with more frequent TX intervals)
* APRS (eeech! <smile>)

Please take the time to save this for future use. I'm going to try to
incorporate it into the BEACONet website, too (I'm so far behind in
keeping things fresh there...sorry).

Anyway...thanks, Roger!

Regards,
Ev, W2EV

ps...I've not tested this with UI-View(16). Roger's instructions are
specific to the registered version (UI-View32). Don't be so stinkin'
cheap...register (it's only around $15 US) and use UI-View32. :o)

- -

This is an improved version of the scripting system that I posted a few
months ago. This version saves the complete UI-View32 configuration,
including the station list, not just the INI file.

(All the following is standard Windows operations, but if you get stuck,
I'm sure someone will be prepared to expand on my instructions.)

1. Save the text between the two lines of '*'s at the end of this
message as NORMAL.VBS in your UI-View32 program folder. Otherwise
download NORMAL.VBS from the "UI-View32 Add-Ons" folder of the
ui-view-announce list files area.

2. Create a shortcut to NORMAL.VBS in your UI-View32 program group, or
wherever you want to put it, and call it something like "UI-View32
Normal".

3. Run NORMAL.VBS - it should be just like running UI-View32 normally.

4. Say you want a configuration for use with ISS - Create a copy of
NORMAL.VBS in your UI-View32 program folder called ISS.VBS. Create a
shortcut to ISS.VBS, and call it something like "UI-View32 ISS".

5. Run ISS.VBS. The first time you run it, it will look just the same as
your normal UI-View32. Now set-up UI-View32 as you want it for use with
ISS.

6. When you're happy with your second set-up, close UI-View32, and run
the Normal one again - you'll find that you still have your normal
settings. Go back to the ISS one and you'll find that you still have
your ISS settings.

7. You can create as many different configurations as you want, simply
by making copies of NORMAL.VBS with different names, and creating
shortcuts to them.

8. Note - If you run UI-View32 from the original program icon that
doesn't use a script, you will be using whatever script configuration
you last used. So once you start using scripts, it's best not to use the
original icon.

```
9. If you find that when you try and run the VBS files, Windows doesn't
know what to do with them, then you need to download the Windows
scripting engine from -

http://www.microsoft.com/msdownload/vbscript/scripting.asp

I think the scripting engine has always been part of Win98, but it
wasn't included with Win95, although it was installed as part of some
Microsoft applications.

A-ha! Another success! :o) I was looking specifically for folks using
the BEACONet frame format (CALL>bsnpah-#,NOCALL:[GR##ID]). Sorrry that
I missed, you Kevin.

As an fyi...the frame that you used is 72 bytes long. A BEACONet
formatted frame would have been only 43 bytes long...and included more
information to study (because bsnpah-# would have conveyed 5-watts,
4-element yagi, etc.).

To setup for BEACONet frame, do the following:
Latitude: delete
Longitude: delete
Unproto: bsnpah-#,NOCALL   (a bsnpah-# calculator is
                                        available from the website @
                                        http://go.to/BEACONet ,
                                        Configuration, Config Code)
Comment Field: [GR##ID] email@host.com
UI-View Tag: unselected

Using a shorter frame will increase one's opportunity for success by
being able to "sneak" between other people's transmisions. Even
so...congratulations on your success!

Regards,
Ev, W2EV

Ev - Shouldn't downlink freq for ISS be 145.800??

"* BEACONet-ISS (144.99up/144.80dwn with more frequent TX intervals)"

>From an earlier "clip" you had :
TX Frequency: 145.990 FM @ 1200 baud
RX Frequency: 145.800 FM @ 1200 baud

That agrees with ARRL site - "Tentative operating frequencies for
routine ARISS operation are: Worldwide downlink for voice and packet,
145.80 MHz; worldwide packet uplink, 145.99 MHz; Region 1 (Europe) voice
uplink: 145.20 MHz; Region 2 and 3 voice uplink, 144.49 MHz. "

You got me, Bruce. I goofed. The ARRL site (and my earlier clip, too)
is correct. All of the ISS frequencies are 145-MHz (.990 & .800).
Sorry for the misinformation, folks. It was an honest mistake.

122. [propnet] semi/aprs/rocket

From: Kevin Deckert <kdeckert@wellsgray.net>
Date: Wed, 18 Apr 2001 18:12:45 -0700
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-7769-2001.04.18-20.30.56--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Recent conversations betwen ve7whk and ve7mob have developed into the
following proposal.

    If we could find enough propellant MOB has offered his truck as a
means of reaching the International Space Station.
The purpose is to assist the astronauts to get their amateur equipment
fully operational! MOB being one to never pass up an oppurtunity to
promote amateur radio, and WHK being one who relishes difficult tasks.
    In order to ease the transition from highway hauler to orbital
module it has been decided to start the veehikle on rails until it has
reched sufficient velocity to launch.
    The Rail line to the top of Pikes peak in Colorado would provide
access to 14,000 feet and a fairly steep launch angle.
seeing as how our friends to the south are always willing to help those
in need....we need only to reach an orbital altitude and be spotted by
the ISS crew at which time they would "rescue" the "repeaternaughts". In
thanks for their efforts we would repair the equipment and give them
some operating ideas and techniques.
    A suggestion was made to take along the fellow who is trying to buy
a ride on the ISS for 20 million, we are sure we could do it for much
less and have some money to spare when we (should we) return.
    To help garner sponsorship, we would put solar panels along all
sides of the trailer and the top and take along a good set of booster
cables. That way we could help to supply some power to california.
    In the interest of saving money we would use a fairly short fuse for
the launch propellant so we would need the assistance of a volunteer,
preferably single and a good runner!
MOB already has APRS in his rig so armchair folks could monitor the
progress.
Due to weight restraints at this time we would be unable to take any
passengers except of course for those with wheelbarrows full of money!
    Lanunch date and final preparations are dependant on a few minor
things such as a propellant source, the proper paperwork and permission
form insurance corp.   ve7whk

124. [propnet] Wanted: BEACONet stations with Atlantic Views

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Thu, 19 Apr 2001 18:25:40 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-7965-2001.04.19-17.44.46--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Take a moment to ponder the following:

Brendan Trophies for the first terrestrial transAtlantic 2-meter QSO:
http://www.irts.ie/brendan.htm

KH6HME Hawaii CW beacons run 60-watts and 14 element beam aimed at
California. Total ERP of around 1200 watts (60-watts & 13dBd gain)

The KH6HME to continental DX record is in the area of 4900 km.

The distance from North America to Europe is around the same distance
(actually shorter on some paths), and includes some very warm seawater
due to Gulf Stream activity.

BEACONet^31 is almost 20dB more sensitive than is a CW signal being
received on a typical multimode 2-meter transceiver (with a frequency
bandwidth of 2.5 kHz)... 10Log(2500/31.25) = 19+dB (we'll call it 20)

A 25-watt 2-meter transceiver running PSK31srv & UI-View (this is called
BEACONet^31, by the way) into a 7-element beam (10-dBd) has an ERP of
250-watts. PSK31, gives this station an additional 20-dB advantage.

Do the math...BEACONet^31 was designed to break the transAtlantic
barrier. The only question is...who is up to the challenge? Is there
anyone with an Atlantic Ocean view on the list, willing to dedicate a
transceiver to an experiment that could take a year or two to fully
explore? Is there anyone on the list in Europe (or Africa for that
matter), with an Atlantic view willing to hook up for this exciting
experiment?

Let's hear it, folks! It won't be me (I'm on the south shore of Lake
Ontario...well too far inland to participate)...but I'm very willing to
coach anyone willing to make a try of it.

Ev, W2EV

I am running UI-View on my computer with a Kantronics TNC and a 2
metre band mobile radio. Will PSKsrv make any improvement with what I
am doing?

> I am running UI-View on my computer with a Kantronics TNC and a 2
> metre band mobile radio. Will PSKsrv make any improvement with what I
> am doing?

Hi John,
As is often the case, the answer is "it depends". :o)

BEACONet and BEACONet^31 are two very different systems...which are not "compatible" with each other because each uses a different "modulation scheme". BEACONet uses standard AX.25 protocols while BEACONet^31 (with the use of PSKserv+Computer SoundCard) uses PSK31.

BEACONet^31 is well adapted to e-x-t-r-e-m-e-l-y marginal paths, where it is likely for propagated signals to be 10 to 20 dB's down from levels that are decodable using AX.25-based BEACONet. That is why it is being suggested for use in a transAtlantic tropospheric path.

For the time being, it (BEACONet^31) is not (yet) well suited for general BEACONet operation because of the critical tuning component and relatively slow transmission speed (a 200ms BEACONet transmission takes 15 seconds on BEACONet^31). Of course, we may find ways to take advantage of the system as we experiment more with it (which I hope that we continue to do, by the way).

So...this is sort of a long way to say...BEACONet (UI-View + TNC) is the best combination for utilitarian work.

However...if you are looking for suggestions for improving your system performance, then I can suggest one thing that will definately help (if you haven't invoked it already). Kantronics has a function called "CD SOFTWARE". It allows you to run with your squelch "wide open", allowing you to decode weaker signals. Invoke that command before launching UI-View and open your squelch. You'll see noticable improvement.

Regards,
Ev, W2EV

Rendered body type: text/plain

Lyrid Meteors to Peak

The Lyrid meteor shower has been observed for more than 2,600 years; Chinese records say "stars fell like rain" in the shower of 687 B.C. But in recent times the Lyrids have generally been weak. They have a brief maximum that lasts for less than a day, and even then only 10 to 20 Lyrids per hour may appear.

In 1982, however, the hourly rate unexpectedly reached 90 for a single hour, and 180 to 300 for a few minutes. A brief outburst of 100 per hour was also seen in 1922. "This unpredictability always makes the Lyrids a shower to watch, since we cannot say when the next unusual return may occur," note Alistair McBeath and Rainer Arlt of the International Meteor Organization.

The radiant point of this shower lies between Vega and the keystone pattern of Hercules. This year's peak activity is due around 4h UT on April 22nd (midnight Eastern Daylight Time on the night of April 21st), with the radiant high overhead in western Europe and well up for observers in eastern North America. The waning crescent Moon won't interfere.

129. [propnet] 2 meter FM - PSK vs AFSK(packet)

Rendered body type: text/plain

John and Ev - One other factor to consider is PSK31 is primarily intended for SSB mode and unless you 2 meter rig is all mode, you are stuck on FM. While PSK can be used on FM, it would be via soundcard (and interfacing such as "RigBlaster") not your TNC. Not sure how many would be set up to receive PSK on FM set. See page 81 of the Oct. 2000 QST for short article by W6KAG on using PSK on FM. I'd like to give it a try sometime. Sounds counterproductive to use narrow band modulation technique on "wide" FM signal but apparently it works well.

Bruce makes an excellent point...one that I had assumed was common knowledge, but am glad that he made. The BEACONet^31 attempt at spanning the Atlantic Ocean will require a 2-meter SSB transceiver (hence the statement "the modes [BEACONet and BEACONet^31] are incompatible").

However...I've learned that Roger's implementation of PSK31srv is not as tuning-critical as I've been led to believe...especially given the scanning ability of his software. It is really a well written application.

The offer still stands...we're looking for a couple of BEACONet-ers with Atlantic Ocean views. I've lined up an EA8 (Canary Islands) who is so excited, he is building 4x7 element beams *just for this project*. I've also lined up a Florida station, too. Since we don't know the path that is most likely to support the transAtlantic mode, we are well served by "blanketing" the coast and seeing what we get.

Regards,
Ev

Rendered body type: text/plain

The Lyrids are a goofy shower...it's an all-or-nothing event. The reason that I've not really promoted it for BEACONet-probing is because I didn't want to hype a lot of interest, only to have no success at all (which is a pretty good bet, actually).

However...BEACONet is all about experimentation, after all! :o) If anyone cares to join-in, Rich and I will be attempting the first 223-MHz packet meteor contact tonight and tomorrow. We'll be on 223.78 MHz from 11:00 pm until 11:00 am on both Saturday (tonight) and Sunday (tomorrow), using BEACONet's Meteor Mode.

This is just an impromptu attempt...however...this is an excellent reminder that the eta-Aquarids shower is just a couple of weeks away (the 5th of next month). If you haven't had a chance to register on Rich Parry's site, please do so! (http://go.to/METEORegistry) I'll be on 53.530 MHz, 147.585 MHz and 223.78 MHz (all three) looking for other BEACONeters! More information on Meteor Mode is available on the BEACONet website (http://go.to/BEACONet). There you will find not only instructions for participating (don't forget to use your configuration code), but also some screen shots of previous meteor successes!

Join us for the fun!
Ev, W2EV

223.78 MHz, 1200 baud FM
150 watts

4-element beam aimed south-south-west from NY

I do not have full Beaconet capability on 220 yet, but I will hook up the
TNC to the 220 tranceiver audio, set it to 223.78, leave it running over
night and check MHEARD next morning to see if I have anything.
 The only 220 antenna I have at the moment is a discone, so I'm not too
hopeful, but who knows?
Good luck guys.

I have a 10 element 220 yagi currently in pieces. (Given to me by a friend
"There's never anything on 220 you may as well have it")

Once I get it together, I will be able to mount it at about 40 ft, but I
will have no way of rotating it. I hope to get a rotator some time soon,

but given that I will have to bolt it to the pole, pointing in some fixed
direction, what would be the best direction to point it for meteor work?
I'm on the east coast at a latitude of 42 degrees. Gut feel tells me that
North West might be good, but I'm not sure. Maybe I should just point it at
a known station like Ev?
Any ideas or advice?

Same argument applies to the 2M 3 element I have.

THanks for any help.

Hi John,
It is best to always point in the direction of the station that you wish
to work and let the meteors do the rest. At this time, the only
stations that are playing on 223.78 are Rich and I (and now you). If I
were you, I'd point at Rich.

By the way...Since Rich and I are the only two playing on 223.78, I'll
be TXing from 0-14 seconds after the minute, then again from 30-44
seconds after the minute. Rich...you may not have enough "stooch" in
your solar-powered batteries to do that, but if you do, setup to TX at
"15,45". We might as well use the whole minute. :o)

I'll be powering-up at 11:00 pm eastern, and running for 12-hours.

Ev, W2EV

Hi Ev
I am about 300 miles short of an ocean view. I have worked the coast of SC.
on 6 and 2 meters and came close on 70 CM. I do have an all mode rig for 2M
that hardily gets turned on. I would be willing to buy a good amp for the
project. I also have a long boom SSB (not resonant above 145 MHz) yagi at 50
feet. If I can be a viable part of the project let me know.

Hi Dave,
Gee...I hope it's not your computer. Try shutting that off first and
seeing if the signal goes away. Drop me back a note to let me know what
that did (if anything) and I'll help you along from there.

You will want to join the BEACONet/PropNET listserve, too. There is
plenty of interest in California...and floating a message to the whole
group can bring experts out of the woodwork, too.

Instructions are on the BEACONet web site (http://go.to/BEACONet) at the
top (in the light blue).

Welcome aboard!

Ev, W2EV
PS...I'll forward your eMail to the listserve so that others in the area
can keep an ear out for you, too.

I thought perhaps you might have an idea.
>
> What I hear sounds like some sort of wide-band frequency-shift signal, centered about 585, but
extending from 147.570 to .600 or thereabouts. The signals I hear are quite strong, peaking over S9 on
my meter. They have continuous shifting-pitch components that sound like muddy packet in the 300-Hz
range, and there are also higher-pitch (maybe 700 Hz) tones interspersed. They come in 2- to 15-second
bursts, with short or long idle periods in between. At least once I have heard a short CW signal, but it
 doesn't decode well on FM and I haven't been able to copy it.
>
> At first I suspected equipment trouble, but I find perfectly readable signals on the usual packet
frequencies, so I know the PK-88 and the receiver are working OK.
>
> At any rate, are there any BEANCONet fans in southern California, and are they using a different
frequency? I'm leaving my beacon on for a few days, but I don't think I'll hear anything on 147.585.

I'm trying to get my station going again. I set up UI-view as per level 2
instructions. I am using version 2.32. Under Digipeater setup it says to set
TRACEn-n=x. I do not have this option. I have WIDEn-n and HOPn-n. I do not
beleive that would cause my real problem though. Nothing happens. I set the
beacon time to 1min to test things out. Nothing. The TNC is a Kantronics
KPC-3.The TNC works with other programs, so it must be something I'm doing
or not doing with UI-View. Thanks for any help.

Hi John

I am in EM84NM South Carolina. I want to put a BEACOnet beacon on 223 for the
E season. If you point your beam this way we can experiment. I will be
running 120 watts into a home built 13 element Quagy at 40 feet feed with
hard-line and point her up the East coast (only known 223 activity). I am not
sure if it would work but maybe you can split the difference (beam heading)
between Ev and I and let her play. I am glad to see your interest in 223 MHz.
I though that I would be sending a beacon only to Ev. As interest grows in
223 Ill stick a ground plain out of a pine at about 80/90 feet. Right now my
SWR went crazy and I am not able to TX on 223 but I hope to fix this problem
Sunday and be ready for the shower on May 5. Hope to see that you are ready
by then.

Hi Rick,
I will check out the instructions on the website right away. If they
say TRACEn-N=x then they are wrong. It should read HOPn-N=x. This will
allow your station to be a HOPn-N digipeater for other stations to use
(which is a *very* good thing, by the way).

There are three principal reasons for the symptom that you are
experiencing:
* There is no communication between your computer and TNC (doubtful
  the problem, since Meteor Mode seems to work for you)
* You forgot to issue the command RESTORE D prior to setting up
  (meaning that you skipped the "Level-I" instructions quite
   innocently)
* UI-View has become corrupted

The first thing I'd do is assure that you have communication between
your TNC and computer by establishing a connection using HyperTerminal.
If you are not successful, then work on that a bit.

If you are successful, then issue the RESTORE D command, and follow the
instructions for Level-I, then go on to Level-II again.

The last step is the reinstallation of UI-View (there is an uninstall
program under the UI-View menu in Windows).

Please try this stuff, and let us know how it worked out, would you?

Welcome back, by the way! :o)

Regards,

Ev, W2EV

Having BEACONet settings in UI-View a little and having played with PSK31SRv
a little, I think I've missed reading about setting PSK31Srv up for BEACONet^31.

Could someone point me towards details of what I need to setup in the
various options for both programs please?

I may be too far in-land to do transatlantic tests, and have not yet put up
a beam for 2M at this house, but I'd be interested in seeing what could be
done with BEACONet^31.

Thanks de Dave (G0DJA)

"UK Dave" :-) wrote...
> Could someone point me towards details of what I need to setup in the
> various options for both programs please?

Setup is straightforward, ol' friend. The PSK31 preamble is changed to "BEACONET" (from APRS) and the Checksum is enabled. As for UI-View...BEACONet^31 uses the same settings as does BEACONet, with the exception that "Beacon Interval Internet" is set to 5 minutes (and Beacon Interval Fixed is set to 0)...which makes sense since PSK31srv fools UI-View into thinking that it is connected to the Internet).

If any of this comes across as "we already know what we are doing on BEACONet^31" then I've done a poor job...because we don't, Dave. BEACONet^31 (the use of PSK31 instead of a packet TNC) is in its' embryonic stages of development right now. It just so happens that we are fast approaching a time of the year when I believe we could experience transAtlantic propagation on 2-meters, and BEACONet^31 is probably the tool that it will take to make the path.

I would *love* to find an HF frequency to experiment on in preparation for this eventuality. Originally, we suggested 28.128 USB (side-by-side with BEACONet on the same frequency), but am now thinking that 28.131 USB is a better choice. It will allow a lot of Technician-class stations to join us in the USA. If we try another band (for more consistant propagation), then we lose the Tech's (I don't know if they have data priviledges on any other HF bands).

By the way...don't be too conserned about being "too far inland" in the UK to participate in the transAtlantic experiment, Dave. I hear tell (from the interested EA8 on the Canary Islands) that the summer tropo season for him extends well inland in the UK.

We have firm commitment from N2VRJ/4 on the Gulf-coast (the "wrong" coast of Florida) to participate. Given that Florida is quite flat, I doubt it will be a big deal. He's setting up now to experiment on 28.131 USB to become familiar with BEACONET^31 operation, then will QSY to to 2-meters for the experiment (frequency choice there is still open for discussion).

Whew...how's *that* for a long answer to a short inquiry? :o)

In a nutshell...we still have much to decide and each one of us can be part of the process. (couldn't I have just said that? <grin>)

Welcome aboard, Dave!

Last evening, I reconfigured for 2M using UI-View, KAM + and about 70 Watts to a 3 element beam pointing West (it's fixed and I was not going on the roof in the dark!)
I heard several weak sounding packets on the audio around 11.00PM EDT - left it running all night but nothing showed up in UI-View. Did anyone have any better luck?

I've reconfigured this morning for Beaconet on 28.128 .

Yesterday I had one packet on 28.128 from EA5UB which did show up on

UI-View. This was at 21.27z. Nothing from anywhere else.

Hi Rich,
I'll let you know when I'm ready. Main problem is that when the
beam was taken down by it's previous owner, they were non to careful about
it, so there is some repair work to be done. Hopefully it will be ready in
time for the May event. I also got a 220MHz 120 watt Mirage amp/preamp from
the same source. If that works OK we should be all set.

Hi John

Don, t feel bad about the repair work. My beam is a cut down 2 Meter beam. I
went to a brand name antenna manufacturers web site and got a PDF file of
their 225 MHz beam and copied it to the millimeter and used the directions in
the hand book to turn it into a quagi. Where my problem came in last night
was the connection to the hard-line went south and I was running out of day
light and options. Ill have it rock solid and ready to go by May 5.

I think that there are 2 more stations that were going to get 223.78 up and
running. If so I hope they join in the thread.

Hi John

I ran 28.128 meteor mode last night 100 watts and heard zilch.
2 Meters (100 watts vertical @ 90 feet) produced 2 local stations in Georgia.
Last time I checked one of the stations was still running meteor mode (11

AM.) he usually beams in your direction. He is on 147.585

The Quality column is simply my opinion (High, Medium, Low), nothing
more. BEACONet is designed to sway opinion! :o) For instance...last
year the SSB/CW folks lamented the Leonids. Yet, BEACONet captured a
single meteor event that propagated a half-dozen successful circuits!
(see the web site at http://go.to/BEACONet | Participation | Successes |
Wow!)

The faster the rock (km/sec) the more ionization (and higher the
frequency of propagation...as well as the longer the trail may stay
usable). The more rocks per hour, the greater the chance for success.
The "Quality" above is measured by traditional thought...but I'm
starting to think that we should simply be looking for any shower that
has fast rocks and let the BEACONet "fishing trip" snag 'em all. :o)

You see...we're a little different than our SSB/CW bretherin, in that we
setup and run all night long. While we sleep. :o) They operate in
attended mode and need to pick their showers more stringently.
Hmmmm...I'm already starting to rethink the "quality" thing.

Oh well...this is a good launching point for anyone who is new to the
whole BEACONet concept, anyway. Let's gear up for the eta-Aquarids and
see what we get!

Hi all

I am happy to report that I fixed my SWR problem on 223 MHz and will be ready
for May 5.

Rich

My two meter (AX.25) beacon with omni-directional
antenna is back on the air.

I required back surgery and turned off the beacon
prior to going to hospital. It's using 40 watts at an
elevation of 1230 feet or if you prefer, 375 meters.
Has anyone heard it?

Snaged at 2026 Eastern Time yesterday (I just checked...sorry for the
delay).

20:26:19R KG4EYO>APRS <UI C Len=8>:[EM73PR]

Overall DX was 1,195km!

Unfortunately, without a configuration code, it is difficult to know
just how likely this was to propagate, but a snag is a snag!

If you are unsure what your configuration code is (it goes where you see
the "APRS" above), visit the website at: http://go.to/BEACONet |
Configuration | Configuration Code and use the java-based calculator.
Plug in your station parameters and it will tell you what to put in your
To-Field.

By the way...it looks like I have a neighbor on board, too...N2IXD, just
20km away. :o)

BEACONet: this ain't your daddy's packet radio! :o)

Hi Rich,
It's tough to know just what to expect. Frankly, in California, they
lose propagation within a dozen or so miles of the shoreline...then
again, they're using a mode that is 20-dB's worse than BEACONet^31
<grin>. If you have an all-mode that hardly gets used, then I think
we'd all welcome you in the transAtlantic experiments!

Let's see if we can get at least two more Atlantic-shore stations
on-board, then we'll need to experiment a little on HF to get used to
the PSK31 mode...then do the QSY to 2-meters.

Anyone else game? Hellooooooooo UK, Portugal and Spain!

Rendered body type: text/plain

When it rains, it pours. Just as we were ramping up to make another
assault on a meteor shower, the METEORegistry page has gone south on us.
  Actually, Rich's ISP shutdown quite unexpectedly. And shut down hard.

It's entirely possible that the page won't be back any time soon, which
is truly sad, as it was mentioned in the QST article on BEACONet. Rich
has been a staunch advocate of BEACONet's (meteor) Burst Mode and had
designed a first class website in support of our efforts (over 60
participants registered for Leonids '00 and a slowly growing group of
experimenters for the upcoming eta-Aquarids). Sorry to hear of your
(and our) loss, Rich.

Also...it appears as thought the redirect website that I use is
experiencing a few difficulties, too. I've gotten "Server Too Busy"
error messages when I access the website. Gee...I wonder if BEACONet is
really getting that many hits! (grin)

Anyway...there's two ways to deal with that...
... simply refresh your browser until it gives you a redirect, or
... hit the site directly at: http://www.rochesterny.org/BEACONet

Sigh,
Ev, W2EV

Hi all,
I have returned my station to 53.53Mhz after doing some lurking on 147.585 Mhz for a bit, (no activity heard here). I'll be running this way for the duration of the next M.E. event.
I am running 50 watts into a j-pole at 25 feet above the terrain. Turns out I can't get the full 100 watts output from the Yaesu FT-847 when in digital mode.
I have a 5 element beam I can switch in if someone wants to try for a contact from this direction. Otherwise I'll leave it on the omni-directional j-pole.

You need to create the installation disks using a 32-bit machine. Then,
you can take the install disks and install on your Windows 3.1 machine
(the author says 3.1 is OK, btw). Give that a try and let us know the
specific error message you get if it still doesn't work. We'll help you
through it.

165. [propnet] AstroAlert: Naked Eye Sunspot Alert & Potential Major Flare Warning

From: Cary Oler <oler@solar.spacew.com> (by way of Earl Needham <needhame@yucca.net>)
Date: Mon, 23 Apr 2001 20:59:46 -0600
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-8821-2001.04.23-22.17.23--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

A s t r o A l e r t
Sun-Earth Alert

Solar Terrestrial Dispatch
http://www.spacew.com

23 April 2001

NAKED EYE SUNSPOT ALERT
POTENTIAL MAJOR SOLAR FLARE ALERT
AURORA OBSERVERS STAY ALERT

The huge naked eye sunspot group that produced one of the largest solar x-ray flares in recorded history on 02 April reappeared around the east limb of the Sun on 18/19 April as a less complex, but still respectable sunspot group capable of producing additional major solar flares. In addition, an observation made by Michal Svenda of the Czech Republic (http://apo.astronomy.cz)
indicates that the sunspot group is once again visible to the naked eye. Michal made his observation on 23 April and could discern both the leader and trailer spots with the protected naked eye.

This sunspot group (now known as NOAA sunspot region 9433) is beginning to cross the central meridian of the Sun and is very well placed for observing with the protected naked eye. Please make certain you do not look at the Sun directly. Doing so can permanently damage your eyes. Use an appropriate certified filter or a safe projection technique. Alternatively, users wishing to see activity on the Sun in real-time may access http://www.spacew.com/sunnow. Images provided there are automatically updated every minute (when new imagery from observatories are available) and regularly processed into MPEG movies several times a day.

Analysis of this sunspot complex shows that there is potential for this region to produce major solar flares. Renewed growth has been observed over the last 24 hours. It still retains sufficient magnetic complexity to spawn potential major x-ray flares. There is also a notable chance of a proton flare from this region.

At the time of this writing, there are no known Earthward directed coronal mass ejections. However, this could change at any time should a major solar flare erupt from sunspot Region 9433. Aurora observers are encouraged to keep a close eye on conditions over the next week. Region 9433 is in an ideal location for producing Earthward-directed coronal mass ejections.

As a side-note and of potential interest to fellow aurora photographers, a series of outstanding images of the auroral storm of 11 April were captured on film by Ulrich Rieth (http://www.ulrich-rieth.de). Click on the "Aurora 2001" link and select the bottom link below the bar graph at the bottom for the 11 April images.

Hi Mark,
The software is available from many sources, but in my attempt to make
things as easy as possible, one of them is the BEACONet web site at
http://go.to/BEACONet in a couple of places. You can get the software
along with setup instructions under the hyperlink titled "Construction |
Level II" and "Configuration | Level II". Otherwise, note the hyperlink
at the top titled "Turbo Links -- Instructions? I don't need no stinkin'
instructions!". :o) That's where you'll find links to all the important
stuff without the ... well... you know.

I understand that your Baycom will work with UI-View (the software that
is written by Roger Barker [G4IDE]), though I've never tried it so I
won't be much help in setting it up...though Roger has done a great job
of laying out the interface. I'd bet that you can figure it out without
much help. Then again...Roger lurks on the list from time to time so he
may be of help, too.

The principle advantage of using a "real" TNC is that it can be setup as
a "Level-I" station. That means that one can configure it once, turn
off their computer (leaving the TNC and transceiver turned on) and let
their BEACONet station run, providing signals that others can use to
track rovers, band openings, etc. The best TNC to use is the Kantronics
KPC with ROM 8.2 or above because it includes firmware to allow it to be
a Peer-class station (able to be a HOPn-N digipeater) -- adding to the
'Net' part of BEACONet. If you don't have a Kantronics w/ROM 8.2 or
above, then any KISS capable TNC is next best (one can set it up to be a
TX beacon for others to plot...but it can't digipeat HOPn-N without a
computer turned on).

There is one more option...which I've not fully explored yet. It is
possible to use your computer's sound card as a "pseudo TNC" using
software called AGWPE (AGW Packet Engine). Again...I have no experience

with it so I couldn't help you if you had problems (nor could I tell you
where to get AGWPE, but a web search may come up with something).

Whew...such a simple question and a complicated response. I hope you
found something useful in the above information :o)

Regards,
Ev, W2EV

Johnny,

Thanks for reply, here is portion of my email to Ev yesterday.

I wish installing the software on your machine was easy. METEORegistry is
more complex than it may look. It requires "MySQL" database which is a
significant task to install, configure, and administer. It also requires
several perl modules and graphics libraries to create the maps on the fly.

more later,

Rendered body type: text/plain

Folks,

I'm trying to figure out where to get AGWPE and how to configure it, etc.
Unfortunately, the "No TNC, no problem" text on the beaconet pages has no
link behind it. Where's the best place to obtain this info?

Thanks,
Tony
AA0SM

170. [propnet] METEORegistry down, sorry!

From: Richard Parry <rparry@qualcomm.com>
Date: Tue, 24 Apr 2001 13:56:46 -0700
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-8971-2001.04.24-16.14.25--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

METEORegistry Down:

Just a quick note and an apology for METEORegistry being down during the
current MS event. Northpoint, a nationwide DSL provider went out of
business and cut their lines last week. Therefore, connection to
METEORegistry is not possible, sorry. I have ordered new DSL service, but
it will take 2-3 weeks before it is operational.

A few folks have offered to provide service. Unfortunately, METEORegistry
is more than a simple HTML web page. It requires a database server and
graphics libraries. I spent a lot of time upgrading the METEORegistry web
page and looked forward to it being used.

good luck everyone,
Rich Parry

I ran UI-View overnight with the radio tuned to 147.585 but didn't see

any results when I checked in the morning. I'm on a good hilltop in
Mendocino Kounty, California so I should be able to receive 2 metres
for a couple of hundred miles or so. Is there anyone interested in
BEACONet in North Calif. or the far northern part of south Calif?

Hi Tony,

Here's the web address for AGWPE.

http://www.elcom.gr/sv2agw/general.htm

Here's the address for help on setting up the system.

http://www.qsl.net/soundcardpacket/index.html

73,
Bob

I ran last night on 2m from about 9pm-12am PDT. I'm on a decent hill in the Santa
Cruz mountains and didn't receive anything. Running APRS on the same radio setup
I've seen direct packets from Williams Hill (King City) and the entire SF bay area.
I believe my coverage into SQV is limited because I'm on a south-west facing hill.

Unfortunately I'm on generator/battery power so leaving the computer on all the time
is not possible... I'll keep running every evening this week. The urge to get into
vhf/uhf dxing has been gnawing at me for awhile so when I saw the QST article
yesterday I was up and on the air in less than 1hr. Hope to see more activity soon!

John,
When we played in the very early experimental stages last fall (a little
late for the tropo stuff), we had no fewer than four 6's all along the
coast (and one deep inland). The QST article came out about a month
ahead of when I expect most folks will be back on the air...but here's a
vote for powering up now in California! It sounds like we have a
hill-dweller ready to play.

Power up and have fun, folks!

It's good to have you aboard! This is what BEACONet was designed for.
On an aside, if you setup a Level-I station, you can power off the
computer (saving the battery power), leaving the TNC and transceiver
"on". That's what Level-I was designed for...and if your TNC is a
Kantronics KPC with ROM 8.2 or above, that would qualify you for HUB
Class status...a good thing!

By the way...if there is another active station in range, you can extend
your range by adding the following statement, right after your

Configuration Code: ",HOP2-2". That will cause your signal to "hop"
through two other BEACONet stations in all directions (if they are in
range)...allowing you to see others beyond your range...and possibly
give you that "early warning" should the band start to build just out of
range.

Try it...we did on 28.128 and were amazed with the results. See
http://go.to/BEACONet | Participation | Successes | 10-m Very Cool!

Regards,
Ev, W2EV

OK Ev sounds good. Keep me posted My (PSK31) BEACOnet^31 interface is hooked
to my (grid powered) HF rig. I will need to adapt it the 2 meter rig or build
another when the time comes.

Johnny,

Thanks for reply, here is portion of my email to Ev yesterday.

I wish installing the software on your machine was easy. METEORegistry is
more complex than it may look. It requires "MySQL" database which is a
significant task to install, configure, and administer. It also requires
several perl modules and graphics libraries to create the maps on the fly.

more later,

Rendered body type: text/plain

Hello,

 Name's Bernie / KF4FHS, I live in Yelm, Washington and I'm interested
Beaconet, particularly the PSK experiment. I have been running Digipan for
some time and am familar with PSK31 operation.
 I installed PSK31Srv and the update. The problem that I am having is when
I start the program I get an error saying "Address Family not supported".
when I click OK the program starts and everything looks normal. I tuned to
14.070 to familarize myself with the program but it only prints gibberish.
 I'm sure I've overlooked something simple that will make me feel real
stupid, so if anyone could give me a bit of advice as to where I've went
wrong I would sure appreciate it.

Thank-You & 73,
Bernie / KF4FHS

I hope so...but if not, don't dispair. We're about a month away from Es
and stations from outside of your area being plotted. BEACONet is a lot
like fishing...sometimes we wait a while to be rewarded with the big
one. :o)

Hi Brian

Try 14.095 be sure that BPSK is checked in PSK31Srv. I received 31 stations
today. Granted some of them were weird. One station showed up in the middle
of the Atlantic. LOL

Michael,
Forgot to mention I am beaconing at a 5 min. rate during the day, but will
switch to meteor mode when night falls, about 8:30 tonite. Transmitting
beginning 30 seconds after the minute on each minute.
Good luck.
Wayne

5-minute beacons is probably plenty, actually. Then
again...experiment...it's a good thing. :o)

Rendered body type: text/plain

In Europe, there is a community of APRS users that use FM on 29.250 MHz
(we cannot, in the USA as FM data is not allowed on 10-meters for us).
Here is a thread lamenting propagation there...

>> Am I the only one left on 29.250 FM 1200 baud APRS??
>> I know that the high levels of magnetic activity has disrupted
>> 10 metres for the last couple of weeks, but ...
>
> Well I gave up 29.250 FM because the band was dead half the
> time, and I was only seeing 2 stations in Greece direct.

Don't lose track of the BEACONet mission though...we probe for those
elusive openings and may need to be patient between them. We're on a
24/7 propagation fishing-trip. :o)

On an up-note, I've since fixed my 28.128 station (lightning damage) and
will be rejoining the efforts by tomorrow again.

Rendered body type: text/plain

So -- quick question --

      I have an MFJ 1270B TNC with a custom PacComm chip in it. this chip
DEFAULTS to my callsign and various other settings to operate as a tracker
in my car. If I do a hard reset on this TNC, it STILL has my callsign and
all the other settings in it.

      Now -- is something similar available for the Kantronics KPC-3 (NOT
plus)? I'd like to have such a chip burned with KD5XB-9, terminal baud
rate set to 4800, path set to RELAY,WIDE3-3, etc. Is such a thing
available for the KPC-3 (NOT plus)?

      Thanks,
      Earl

Ev,

  The TCP/IP took care of the error message I was getting, and I have been
able to narrow the other problem down somewhat.
  It seems that Digipan and PSKSrv don't like each other. When they are both
installed on my machine neither one will work, even though I only run one at
a time. As long as they are both installed the waterfalls only shows about
1kc. on the left side of the screen, and the print is unreadable, this is
with both programs, I uninstalled PSKSrv and DP started to work normally
again. I reinstalled PSKSrv and the problem came back.
 I guess I'm going to have to choose between one or the other.
                        Thanks & 73,
                      Bernie / KF4FHS

Here are some snippetts from an eMail I just received. If you haven't
done so already, please join us in the propagation tracking fun!

Ev, W2EV

btw...I've encouraged the writer to join the listserve. With any
fortune, we'll have yet another resource on 10-meters to track.
- -

I found your beaconet info very interesting. From the info provided
in QST I am about 75 % prepared to contribute on 10 meters.

I have been inactive for some years due to the boredom of VHF/UHF-FM,
etc, etc.so I have lost touch with new antenna developments. I have
contemplated a modified (ugh) CB ground plane vertical all the way to a
homebrew vertical centerfed "thing".

Any ideas on some standard radiator?

196. [propnet] AstroAlert: Non-short-wave stations for timing the eta & mu Gem disappearances

From: Joan and David Dunham <dunham@erols.com> (by way of Earl Needham <needhame@yucca.net>)
Date: Fri, 27 Apr 2001 07:12:45 -0600
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-9553-2001.04.27-08.31.22--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

If you don't have a short-wave radio for receiving WWV or CHU
time signals, or something more sophisticated (and expensive) such
as a GPS video time inserter, for large areas of North America
you can record one of the broadcasts below as a time base for the
occultation:

Area:	Station	Frequency & master tape recorder
Most of the USA, from Calif. to New England and Texas (and can be received rather well in Washington, DC area)	WLS	890 Khrz AM clear-channel station, Chicago, IL David Dunham, dunham@erols.com
Ontario, nearby States, s. Quebec	?	680 Khrz AM clear-channel station, Toronto, ON Wayne Yeo, swyeo@home.com for eta Gem only
within about 50 miles of Philadelphia, PA	WHYY	? FM station Alfred Webber, Astronal@aol.com for eta Gem only
within about 40 miles of Washington, DC	WJLA	Channel 7 TV, MUST BE OVER-THE-AIR (not cable) David Dunham, dunham@erols.com for eta Gem only

The first 3 are radio stations, which you should just record
with the audio as you videorecord the occultation; two minutes
surrounding the time of the occultation should be sufficient.
But if you are in the Washington, DC area (as far away as
Baltimore), it would be better to videorecord a minute or two
of WJLA's video broadcast by aiming your camcorder at a TV
playing the station from an OVER-THE-AIR broadcast (must NOT be
cable; the quality of the picture is not important, as long as
it is barely recognizable, and for the TV, the audio is not
needed) about 5 minutes before the occultation, then of
course point the camcorder instead at the Moon during the
occultation to record it, then again record a minute or two
of WJLA after the occultation.

Of course, if you do have a short-wave receiver, it would be
better to record WWV or CHU if you can. Copies of tapes with
WWV or CHU recorded can be accurately time-inserted for
determining accurate times by

Rick Frankenburger e-mail rickf@stic.net
8702 Timberbriar Dr.
San Antonio, TX 78250

Those using the non-short-wave broadcasts should first
contact the person above making the master tape for the broadcast
used and wait for further instruction about what to do with
their tape. Good luck with your observations; the weather
forecast seems to be quite favorable for most of the USA.

Hi,
Thanks for the reception report. Many many 300 watt packets were sent, only one caught!
I changed from the CQ-# format to APRS so that i could monitor the beacon using a TH-D7a. i really like to know that my packets are good. Is there a way to beaconNET using your settings that will allow THD7a and TM700D users to see packets? All of the relevant propagation info is actually listed on the registration web site.

Respectively submitted,

Wm Seffens

<chop>

Ev, I don't see the Arietids (peak June 7/8, 60/hr) or the Zeta Perseids
peak (June 13/14, 40/hr).  Reading up on them at
http://spacescience.com/headlines/y2000/ast06jun_1m.htm, it appears these
may be great for radio work since the rocks travel around 75,000 mph.

These may be typically overlooked in people's event lists because they are
daytime events with radiants very close to the sun.

I think I'll gear up for these two also.

Rich

Yes, sure enough these are daytime showers that often go overlooked (and
shouldn't (especially the Arietids).  The point of the eMail was to show
that there are many aspects to consider when contemplating one's
probability of success with a given event.  That's all.

Nice catch, though!

Hi Bill,
The registration site has gone south (probably permanently,
unfortunately), due to the hosting ISP going out of business. We're
back to square one on that front. :o(

I'm conserned about your comments about the TH-D7a/TM700D users not
being able to decode CQnpah-# packets. That is perfectly allowed in the
APRS spec and I was assured by Bob Bruninga that they handled it ok. Is
that not the case? A lot of decisions were made with that as an assumed
truth.

Would you verify that for me, please?

Ev, W2EV

By the way...you did say CQ-#, right? VK-# is treated as an ALTNET and
not decodable on the radio's that you mention.

Hi Bernie,
I didn't intend to be a "middleman" in this conversation...but it looks
like there is something that is at issue with your particular
installation. See Roger's comments below.

Ev, W2EV

204. [propnet] [cq-l] CQ News: Sunspot 9393 is coming back

From: W2VU@aol.com (by way of Earl Needham <needhame@yucca.net>)
Date: Fri, 27 Apr 2001 17:46:22 -0600
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-9699-2001.04.27-19.07.02--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

NASA Science News reports that Sunspot 9393 -- the largest sunspot of the
current cycle and responsible for the biggest solar flare ever recorded -- is
making a rare second appearance on the Earth-facing side of the sun. The
sunspot, 13-14 times the size of Earth, was responsible in early April for a
huge geomagnetic storm and auroras visible as far south as the southern US.
Normally, sunspots do not last long enough to still be there when the sun
finishes its 27-day rotation, but this one is still going strong, and
scientists have been able to track its progress with the SOHO satellite even
as it passed over the far side of the sun. Full details are available on
NASA's Space News website at >. <<A
HREF="http://science.nasa.gov/headlines/y2001/ast27apr_1.htm?list133325">
http://science.nasa.gov/headlines/y2001/ast27apr_1.htm?list133325</A>>.

In other ham radio news headlines:

Two amateurs were aboard that missionary plane that was shot down in Peru
last week, and one of them was killed.

The OSCAR-40 satellite may be flying with a hole in one side, but AMSAT-NA
President Robin Haighton, VE3FRH, is convinced that "we're going to end up
with a darned good satellite" and says some transponder operation may be
possible by this summer.

Details on both of these stories are posted on the news page of the CQ
website at <<A HREF="http://www.cq-amateur-radio.com">
http://www.cq-amateur-radio.com</A>>.

CQ Editor Rich Moseson, W2VU, will provide a preview of the June issue of CQ
this Saturday night on the "Spectrum" radio program, on WWCR Radio, 5.070
MHz, at 11:00 pm eastern time (0300 UTC). If auroras have wiped out the
shortwave bands, the broadcast is also available on the internet at <<A
HREF="http://www.orn.com">http://www.orn.com</A>>. Click on live feed at the
appropriate time to hear the "Spectrum" broadcast.

Thanks for forwarding these reports, Earl. It's a good "heads up" for
BEACONet on 10-meters.
Ev

Ev and Bernie,

I have Digipan 1.6d and PSK31Srv both installed and can switch between them
without any problem.

Have been trying PSK31Srv this evening on 14.095 and so far can copy N1NCO
with a couple other weak ones trying to break through.

Bob - KC5DUI

207. [propnet] 14.095 this evening

From: "John Atkins" <john.atkins@110.net>
Date: Fri, 27 Apr 2001 21:3:27
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-9718-2001.04.27-21.21.06--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I've benn checking out 14.095 and have got some good signals from
Bob/KC5DUI and a few other places. Here is a snap of what I have so far.

2001-April-28 01:22 5 stations

Callsign	Type	Latitude	Longitude	Km	Bearing	Last Heard
N1NCO*	Home	42.28.65N	071.26.71W	0.0	0	Apr 28 01:21
KC5DUI*	Grid Squ.	[EM26WE]		2070.8	258	Apr 28 01:02
ND-9*	Car	46.27.94N	000.47.42W	5449.5	60	Apr 28 00:59
-GEE*	Grid Squ.	[EM26WE]		2067.5	258	Apr 28 00:21
-BZ}-UI*	Grid Squ.	[EM26WE]		2068.2	258	Apr 27 23:21

Time is UTC

It seems that when using PSKSrv, the length of the preamble is important
because it gives PSKSrv time to sync up before the real APRS data arrives
from UI-View. I've used CQ CQ CQ DE for the preamble, but I wonder if there
are some special combinations of letters which would help PSK31 sync up
faster? (E.G. the ZC ZC ZC used by RTTY) Anyone knowledgable about the
inner workings of PSK know the answer to this?

I was planning to go to 28.128 1200 packet tomorrow morning, but this was
so much fun tonight, I might just stay on 14.095 and see what happens as
condx change!
The settings Bob and I used were/are Tx fixed at 1200, Rx=TX not set and a
50Hz scan. These settings seemed to be working well for Bob, so I set mine
there also and got the results as shown above. I'm using PSKSrv Version
1.08

208. [propnet] AstroAlert: Middle Latitude Auroral Activity WATCH - 28-30 April

From: Cary Oler <oler@solar.spacew.com> (by way of Earl Needham <needhame@yucca.net>)
Date: Fri, 27 Apr 2001 21:36:33 -0600
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-9726-2001.04.27-22.55.37--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

A s t r o A l e r t
Sun-Earth Alert

Solar Terrestrial Dispatch
http://www.spacew.com

27 April 2001

MIDDLE LATITUDE AURORAL ACTIVITY WATCH - 28-29 APRIL

An Earth-directed coronal mass ejection observed on 26 April is expected
to impact the Earth and produce periods of minor auroral storm conditions
over high and dark-sky middle latitude regions. A middle latitude auroral
activity watch has been issued for the 28-29 April UTC days. Impact of the
disturbance could occur anytime after approximately 12:00 to 15:00 UTC on 28
April (8 am to 11 am EDT). Observers should monitor conditions carefully for
possible signs of activity on these dates.

A trial version of the STD Aurora Monitor is available for free download
from: http://www.spacew.com/aurora and will assist people interested in

watching conditions in near real-time.

PLEASE report any sightings of auroral activity to the global auroral activity observation network at: http://www.spacew.com/www/subaurora.html Current sighting reports made by others in real-time can be found at: http://www.spacew.com/www/auroras.html. Lively real-time discussions of activity are also available at: http://www.spacew.com/irc as well as on a public forum at: http://www.spacew.com/aurora/forum.html

The middle latitude auroral activity watch has been appended below.

/\

MIDDLE LATITUDE AURORAL ACTIVITY WATCH

WATCH UPDATED: 23:20 UTC, 27 APRIL 2001

/\

VALID BEGINNING AT: 12:00 UTC ON 28 APRIL (8 am EDT, 28 April)
VALID UNTIL: 19:00 UTC ON 30 APRIL (3 pm EDT, 30 April)

HIGH RISK PERIOD: 29 APRIL (UTC DAYS)
MODERATE RISK PERIOD: 28 - 30 APRIL

PREDICTED ACTIVITY INDICES: 15, 40, 20, 12 (28 APRIL - 01 MAY)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE

POTENTIAL DURATION OF THIS ACTIVITY: MAIN BELT = 12 TO 18 HOURS
MINOR BELT = 18 TO 36 HOURS

ESTIMATED OPTIMUM OBSERVING CONDITIONS: NEAR LOCAL MIDNIGHT

EXPECTED LUNAR INTERFERENCE: LOW TO MODERATE

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR TO GOOD

AURORAL ACTIVITY *MAY* BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

WASHINGTON STATE TO WYOMING TO SOUTHERN SOUTH DAKOTA TO NORTHERN IOWA TO NORTH-CENTRAL ILLINOIS TO INDIANA TO OHIO TO PENNSYLVANIA TO DARK-SKY SITES NEAR NEW JERSEY AND LONG ISLAND.

ACTIVITY *MAY* ALSO BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

NORTHERN IRELAND TO CENTRAL ENGLAND TO EXTREME NORTHERN NETHERLANDS AND NORTHERN GERMANY TO NORTHERN POLAND TO NORTHERN BELARUS TO A LINE ROUGHLY NORTH OF THE RUSSIAN CITIES OF VELIKIYE LUKI TO CHEREPOVETS TO UKHTA, ETC). ACTIVITY MAY ALSO BE OBSERVED FROM SOUTHEASTERN AUSTRALIA AND NEW ZEALAND.

SYNOPSIS...

Auroral activity is expected to intensify to minor storm levels following the anticipated arrival of an observed Earth-directed coronal mass ejection on 26 April following a major solar flare from active sunspot region 9433. Ground-based communications problems and EIT instrument off-times prevented full coverage of this coronal mass ejection event. However, there is sufficient information to provide an estimated arrival time of near perhaps 07:00 UTC on 29 April, give or take several hours. The impact may actually occur a bit earlier than this (perhaps late on 28 April) if the computed velocity of the disturbance increases once the remainder of the SOHO data is retrieved for analysis.

Addendum: The latest data (as of 23:00 UTC on 27 April) suggests the disturbance may arrive several hours earlier than originally anticipated. We are therefore updating this watch statement to reflect the new arrival time estimates.

This watch will remain in effect until 19:00 UTC on 30 April.

A new service is available for those interested in monitoring and discussing auroral activity and other science related topics in realtime. For more information, go to: http://www.spacew.com/irc

WE HAVE A DISCUSSION FORUM FOR AURORA ENTHUSIASTS AVAILABLE AT:

http://www.spacew.com/aurora/forum.html

PLEASE REPORT OBSERVATIONS OF AURORAL ACTIVITY TO:
http://solar.spacew.com/www/auroras.html

* OR *

Use the STD AURORA MONITOR Software to monitor conditions and
report sightings. It is available at:

http://www.spacew.com/aurora

210. [propnet] Add a new dimension to BEACONet

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Sat, 28 Apr 2001 08:22:19 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-9758-2001.04.28-07.41.41--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Don't forget that there is an "undocumented" feature of the BEACONet
system with which we can experiment...it's called Trace-Digipeating.
Add the statement ",HOP1-1" right after your configuration code. Anyone
that hears you (that is a PEER class station) will digipeat you once.

Why do this?

It's very possible that the band is open from A to B and from B to C,
but not from A to C. Invoking the above will at least allow A to know
that C is active, and may serve as a "heads up" in case the band may be
building for a direct opening.

A good example of this is found on the BEACONet website at
http://go.to/BEACONet | Participation | Successes | 10M-Very Cool!

NOTE: This works only on BEACONet (28.128 USB, 53.53 FM, 147.585 FM),
not BEACONet^31 (28.131 USB), which cannot digipeat.

Give it a try and see a whole new dimension to the experiment!

Rendered body type: text/plain

I recently received an eMail from Mike (N0ALJ) with some information
that I thought would be useful to share a bit for the whole BEACONet
community...

N0ALJ writes..."My BEACONet station consists of an AZDEN PCS-7800H
6 meter transceiver running 50 watts into a Comet Triband base
station antenna GP-15 that covers 2 meters, 6 meters and 70 cm all
at once with a single coax for me and a tri-plexor to split the
signal to 3 separate radios (BEACONet on 53.53 MHz, APRS on
144.39 MHz and 70 cm FM voice). If you have 6 meter BEACONet
capability, listen for my signal from N.W. Arkansas.

I also plan to try out 10 meters occassionally too. I love watching
meteor showers and also try to operate my 6 meter station in meteor
mode. I know that 6 meters requires alot more patience than 10 meters
but that is part of the challenge I guess."

Well said, Mike! Welcome aboard. Let's hope that his years' Es season
treats us better than last years did! :o)

213. [propnet] QST/Website Article Error!

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Sun, 29 Apr 2001 08:37:53 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-9894-2001.04.29-07.57.17--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I *Hate* when that happens! :o) And it's my fault, to boot.

Fortunately, this error will only be evident:
* If you are a Kantronics KPC (TNC) user -and-
* You turn off your computer and let your system operate in Level-I
  (which is a good thing to do, if you need to shut down your
   computer from time to time because it leaves your station active
   for other people to plot and use).

This doesn't affect:

* Users of other TNC's
* Kantronics TNC's when used in conjunction with UI-View (Level II)

I've updated the web site, now I'm updating the BEACONet community (see?
another good reason to be subscribed to the remailer).

Directions for "Level-I" when using a Kantronics KPC w/ROM 8.2 or above
flipped a letter (one stinkin' letter) and changed the whole setup. The
directions originally read:

Configure your Grid   BT 1 [your grid]
-- it SHOULD have read --
Configure your Grid   LT 1 [your grid]

(change the "B" to an "L")

Congrats if you figured this out on your own (I can't believe it slipped
by me twice)! Please make sure that you update your TNC (this applies
ONLY to Kantronics TNC's, by the way).

Thanks to Mike (N0ALJ) for spotting this and bringing it to my
attention!

Regards,
Ev, W2EV

Hi Ev

Though you might not know so here goes.

I went to the FCC HAAT web site today to get the HAAT for 3 antennas and
found that the FCC has stoped the program from calculating ones HAAT do to
some kind of discrepancy in the calculators results. You might want to check
and see for your self because I might have screwed up.

KB0OBT EN35kb, heard N8QLT EN82hl at 03:43 CDT (08:43 Z) on 4/29/2001. 519
miles on 2M.

Equipment at KB0OBT was 8 element vertical polarized beam at 22', pointed
at 90 degrees. RFC 2-315 Brick in shack (preamp on, 150W output), KPC-3
(cd software), ICOM IC-229 H 2m FM rig, UI-view, 'normal', not meteor mode.

Rich, did you hear me? Any opinions anyone, was this Tropo or MS? Rich,
what were you running?

This is my first reception using this mode (other than locals over on the
APRS frequency), so I'm excited!

Ev, or anyone, what should I collect? Just a screenshot including the
contact details?

Rendered body type: text/plain

>From the standpoint of contests, grid hunting, etc., a 'valid' contact involves both stations hearing each other, and some ack of the information exchanged. Obviously most of our propnet contacts do not count as they are often only one-way. But, with Tropo season arriving, what is the possibility of actually having valid contacts? Two way long term communication is common w/tropo. Do we need an enhancement to UI-View to perform the ack?

Sure enough. It seems that the FCC has removed this service due to inconsistancies. Oh well. 'ya win some, 'ya lose some. :o) I'll remove the link until another is found. Thanks for the heads' up guys!

Hi Bryan,

Here's the thing- I saw Aurora warnings for mid-latitudes on Saturday, and decided to try bouncing a signal off the curtain.

I have a 4-element quad (about 9dB gain) and I'm running about 180w. I put my station in Meteor Mode on Saturday afternoon, transmitting in 15-second slots, and aimed my antenna due North.

I noticed last night on the Aurora web sites that some Au activity may be possible here in Southern Michigan. Around midnight EDT I went outside, but there's too much light pollution around here to see anything. Maybe this was Au, who knows?

Unfortunately, I do not see anyone else on my map today, just me.

Rich

colleenlaplante@mn.mediaone.net writes:

> Any opinions anyone, was this Tropo or MS?

Hi Bryan

First of all I am glad to see something did happen this weekend. I haven't
heard a thing on 2 or 10 meters.

It just so happens that I checked the hourly radio rock count on space
weather .com yesterday and it was at 39 an hour. It looks like the Aurora
reach as far south as Teen | NC. I would say you had a 50/50 shot here. My
money is on a rock. Tropo I have no idea if any went on in your area.

One suggestion that might help you figure out what happened is next time run
your log file so you can see if you RX the beacon more then ounce. Also look
at your terminal window (if you still have its info from last night) and see
what is there.
For what it is worth that's my opinion :-)

Soneone on the 10-10 International list was lamenting the lack of
signals on the band, and suggested that "they'd go off to explore DX
elsewhere for a while". I suggested that they try BEACONet...and, lo
and behold...a list lurker decided to to just that!

Below is a note I just received. I thought folks here may be
interested.

Regards,
Ev, W2EV

- -
Ev

Downloaded all the software including the AGWGPE Packet engine as
my ole PK-88 is tied up with 2 meter service. Got everything going
and I am now sending out packets on 28.128 USB. Don't hear a lot of
activity, but, right now I hear a very faint signal that sounds a
bit like clover or AMTOR, too weak to really tell. I'm going to let
this run throughout the evening and see what transpires.

Well...given that this was a "one way", and the received station was in
Burst Mode, it looks like a random meteor. But don't dispair! Tropo
season is starting to build. Hang in there!

> ...with Tropo season arriving, what is the possibility of
> actually having valid contacts? Two way long term communication
> is common w/tropo. Do we need an enhancement to UI-View to
> perform the ack?

This is an interesting question...in several contexts, actually.
BEACONet was intended to be a monitoring system (propagation, contest
rover, etc) rather than a communication medium unto itself.

That is to say...it should tell you that the band is open (and in what
direction)...and you go and fire up the ol' SSB/CW transceiver and work
it. Likewise...it is intended to tell you that a Rover is in the area
(or has just changed grids), and you contact them using traditional
means as allowed by the contest.

However...there is nothing wrong with using BEACONet as a primary
communication mode...as long as such traffic doesn't load the frequency
with such things (that is what APRS is better at anyway).

So...the question becomes...how does a "QSO acknowledgement" occur
succinctly? I think the answer is already before us...but I'd
appreciate some input from other list members:

When a reception is made, the receiving station sends an eMail to the
transmitting station, citing date/time and received configuration code.
If the other station acknowledges (via eMail) similar information...we
have a two-way circuit.

This is not unlike what hapens on SSB/CW/HSCW meteor scatter when you
exchange callsigns, then a report, then R's, then 73's, then pick up the
phone to make sure that the 73's were heard both ways. :o) Yes...that's
how they do it...because there is no real way to end it absolutly.

Rendered body type: text/plain

The "1" in your bsNpah-# configuration code states that your station
will act as a digipeater, should another station send HOP1-1 after the
configuration code. This is a *good* thing, if your system is capable
of supporting it.

How do you know if it is?

1. Use a KISS capable TNC
   -or-
   Use a Kantronics KPC with ROM 8.2 or above configured
   as Level-I AND be using UI-View in Host Mode: None (the TNC
   is then in control of digipeating), rather than KISS

2. If KISS is being used (the *much* preferred method, by the
   way), then make sure you've followed the steps on the web
   site under Configuration | Level II. I've included the web
   site text below, for convenience.

If your station does not meet the above criteria, *please* change your
configuration code to reflect a "0" (zero) as an "N Value". Leaving it
as "1" can mislead others into thinking that your station is capable of
digipeating, when it is actually not.

Ev, W2EV

((Referenced from #2 above))

In your UI-View folder, edit (using notepad) the file called
UI-View.ini. Scroll to the end of the data file and add the following
statements exactly as they appear below:

```
      [DIGI_OPTIONS]
      UI-FLOOD=
      UI-TRACE=HOP

Setup|Digipeater Setup
      Enable Digi = x
      Alias Substitution = x
      HOPn-N = x        NOTE: leave WIDEn-N unselected for now
      Alias(es) = your callsign
      Sub Alias = your callsign
      Dupe Secs = 60
      <OK>
```

Hi,

I set up my UIVIEW station this weekend, but 147585 is completely empty.
Who else is doing Beaconet experiments in the greater Boston region on this
frequency?

(I do hear stations on 145.090, and I tested out my station there. It does
seem to work and capture stations up to about 40 miles without any
problems, so I guess my radio setup is OK)

Thanks,

Ramon W1/PA3EUG ramon@ieee.org

I now have my beacon operating on 53.530 MHz. It's
temporarily running as a Level-1 beacon. When
UI-View is installed and configured, I'll switch to
Level-2 operation and advise the list.

Some of the station information follows.

transmitter: Azden PCS-7500 @ 50 watts
antenna: discone (omnidirectional 0 dB gain)
elevation: 1230 feet (375 meters)
grid square: EN90rg
TNC: Kantronics KPC-3

Well Ev, I don't think I agree that the ack can be just via e-mail. In
HSMS, or even MS SSB, you need to have one of the parties ack back - via
radio. From a HSMS page http://www.nitehawk.com/rasmit/ I found the
following:

REQUIREMENTS FOR A QSO:
The same as for any mode - an exchange of both call signs, an exchange of
some type of information or report, and an exchange of confirmation of the
same.
When a station copies both calls, he sends calls and report.
If he gets both calls and a report, he sends his report & Roger.
If he gets report and Roger, he sends Rogers.
When both get a pair of Rogers (you must have at least two to be sure!),
the QSO is officially complete. However, the other station may not know
this. So it is customary to then send "73" to let the other station know
that it's complete, even though the "73" is not required for a complete
QSO.

Wasn't there a QST article on this back a few months? It was something
about DX protocol in pileups and how mostly the contacts being made aren't
valid because people are leaving out the callsigns, so how do I know the 59
is for me?

73's - Bryan KB0OBT

      Doesn't matter. If you're going for an award, you MUST follow that
awards guidelines.

      If not trying for some award then a QSO is whatever you want it to be.

      I think that, for our purposes (propagation studies), that simply a
ONE-WAY is worthy of note and valid.

I have been giving this some though.

I am in the shack and see W2EV comeing in on 2 M and want to know if he is
RXing my beacon. I have checked my terminal window and see he has been coming
in for 15 min.

W2EV has set up UI-view | Messages | Autorespond with short coded message
like the beacon personality just to have something there.

I send W2EV a short coded message if received he will auto respond. Contact
confermed.

Now lets say that Roger can set up a meteor mode autoresponder we have it
covered or do we?

Will it fit the scope and depth of BEACOnet? Is all this auto stuff practical?

The "problem" (if it can be called that) is that there is no definitive
authority on what a QSO consists of.

Additionally, anyone who has taken a stab at doing it in the past has
done so from the perspective of a point-to-point circuit (even if you
call CQ, you eventually narrow the object of your attention to a single
station)...never a point-cast system (as is the principle behind
BEACONet, which will allow multiple stations to hear each other
"simultaneously").

Here's an opportunity to invent an entirely new "QSO QSLing" system, one
that allows for the use of a point-cast system in establishing the QSO.

Let's keep this thread rolling!

240. [propnet] BeacoNet QSO (was Re: valid contact)

From: kc0iuy <kc0iuy@arrl.net>
Date: Mon, 30 Apr 2001 21:29:02 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-10154-2001.04.30-21.52.52--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hello all,

How about this scenario? A (hopefully) small modification to UI-View that
would have it respond to a received packet with it's own packet plus the
call sign of the received packet. It might play out like this:

I transmit my BeacoNet packet and kc0iuw receives it.
KC0IUY VK1FC1-15,HOP1-1 [EM29DA] kc0iuy@arrl.net

His UI-View immediately responds with his BeacoNet packet plus my call sign
to acknowledge receipt.
KC0IUW VK1FC1-15,HOP1-1 [EM29DA] kc0iuw@kscable.com /KC0IUY/

Then my UI-View responds to complete the QSO.
KC0IUY /KC0IUW/

The formats are certainly open for suggestion. These are still small
packets a would likely get through if propagation is open in both directions.

Are there any comments?

> I set up my UIVIEW station this weekend, but 147585 is
> completely empty.

Not anymore! :o)

It's good to have the Boston Mass area represented, Ramon. We've had three or four participants in your area, in the past. Hopefully, with the recent QST article, more will join us, too. Don't give up.

BEACONet operates in a very different way than what most people initially expect. Most amateur operations use hunting skills. BEACONet is much more like fishing. One sets up and lets the system operate. There may be long periods of time with little or no activity...then the band opens and icons appear.

Every once in a while, we work a meteor shower (May 5th is the eta-Aquarids, by the way) and folks are rewarded with an icon or two from 600-1500 miles away.

We are still in the process of building the BEACONet network...it is in it's very young stages right now...but growing steadily. Consider yourself a pioneer in Boston. :o)

Let your station run 24/7 for a few weeks (as the tropo season builds through summer). Not only may you see some DX, but you'll be providing a signal for others to copy, too. Welcome aboard!

The author of UI-View wrote it in such a way as to allow others to use his engine as a development tool...with the ability to write plug-in type code to accomplish features that he didn't build-in to the core product (a shameless nudge to anyone who writes code, btw).

If anyone is interested in exploring additional UI-View functionality, check-out UI-Path... http://welcome.to/uiview

Just FYI,

Go read up in the handbook on how the moon bounce folks handle this
issue. If they can consider a valid QSO as one in which callsigns,
reports, and ACKNOWLEDGEMENTS are sent and received by both parties
(same as on HF and other terrestrial contacts mind you) over a link
with -276 dB of loss, I think it should fit here to.

Acknowledgment by email... sheesh... I could of had my DXCC 15 years ago
in high school if that were true. Let's don't toss all the rules out
just because it might be 'hard' otherwise.

73,
Tim

Rendered body type: text/plain

Hi Rich,

What a surprise to come home from work today and have a message on the screen saying you'd received my beacon! Didn't have a plot on you but checked the terminal screen and saw the following..... (times are in CDT) (Port=1 is using AGWPE and the soundcard to receive/xmit - Port=2 is a Baycom modem with receive only capability as a "cross" check) .....

15:00:32T KC5DUI>HY1F01-15,HOP1-1 Port=1 <UI C Len=36>:
[EM26WE] kc5dui@hotmail.com {UIV32N}
15:01:45R WD4RBX>HY1F-15,HOP1-1 Port=2 <UI C Len=57>:
>282037zJoin the fun! Info at http://go.to/BEACOnet.html
15:05:32R WD4RBX>APU24A Port=2 <UI C Len=37>:
:KC5DUI   :Just RXed your beacon.{00
15:05:36R WD4RBX>APU24A Port=1 <UI C Len=37>:
:KC5DUI   :Just RXed your beacon.{00
15:05:36T KC5DUI>APU24A Port=2 <UI C Len=16>:
:WD4RBX   :ack00
15:05:37T KC5DUI>APU24A Port=1 <UI C Len=16>:
:WD4RBX   :ack00
15:06:32T KC5DUI>HY1F01-15,HOP1-1 Port=1 <UI C Len=36>:
[EM26WE] kc5dui@hotmail.com {UIV32N}

Didn't show any plots from your Beacon at all - nothing in the terminal screen either. Will leave the system running to see if I can eventually copy your beacon.

73,

Bob - KC5DUI - EM26WE

Interestingly, Roger (G4IDE) sent me the following...

"If I hear your beacon, and you hear my beacon, that isn't a contact in
the way the term is normally used in amateur radio?"

So...the question is...what is attempting to be accomplished by
"validating a contact"? I can take a screen shot of what I have
received. The DX station can do the same. The screen shots can be
exchanged via eMail (they document reception). Done. Right?

hmmmmmmm :o)

Hi Bryan and all

I though about this after I left for work. When you send someone a message using UI-view you can see the amount of tries it takes for the message to get through. When or if it does you see a Y | N in place of the number. That should be enough to satisfy the ack. So what I was thinking it might be something that would in hanse BEACOnet personality. Sort of an optional station information. What I would also like to know about a RXed station is it's up time. Good example today I was in the shack playing with BEAConet stuff and all of a sudden KC5DIU (10 M) popped up on the map. I sent him a message (his personality matches mine) it took about 5 tries till I got the Y (message RXed) and nothing else. I RXed his beacon 2 times in all. So did the band pop open for a short time or did he just turn his stuff at the tail end of the opening? I could send him some E-mail and ask But when the E season is in full swing I could be sending a lot of mail. I run two beacons 2 and 10 meters for now and when interest grows ill fire up 223 MHz.

Also In the station window you can use one of the button options at the bottom (forgot which one used it only ounce) to ask the rxed station to dump it, s MH list. Lots of ways to get the ack when you are in the shack. UI-view won auto ack. I think that auto ack in meteor mode will be a problem traffic wise do to the packet length required if one receives say 6 stations at ounce but is sure would be nice during other forms of propagation. I have more thoughts about Valid contacts and auto ack but I want to think them through don't want to step on any toes.

What you all think?
Rich

Rich,

Have modified my setup a little bit - under APRS Compatibility I unchecked both the "Default msg type
APRS" and "No UI-View(32) extensions" blocks. If I'm reading things correctly and you see my beacon
again you should be able to do a Query from the Stations screen and pull what I put in Station Info. My
 call should now show on your Station List with a "+" symbol. Will be looking for MORE messages when I
get home from WORK tomorrow (wish I could stay home and PLAY BEACONet!).

You bet!
This is the second time that something really cool happened with my beacon.
If you remember you and another station RXed one (and only one I think) of my
packets at the same time. The Cool part is you are in the New England states
and the other station was in the central part of the country and I am in the
South east. Also worth mentioning the TE opening yesterday was quite strong.
25 watts and Antron 99 at 40 feet. The messages were going through on the
first try and ended abruptly. Leonardo just disappeared.

I am hooked on BEACOnet fishing :-))))

Sounds right Bob. I find it just as much fun to come home and see what got
cough in my BEACOnet. Maybe next time you will find a message from me on your
2 meter BEACOnet. I run both of them 24/7. I just checked the rock count and
it is up from 50 to 55 an HR. Think Ill point my beam (6 elements) at you and
run 25 watts meteor mode tonight if you will have your rig on? If you want to
play to Ill be TXing in my normal time slot.

Hi Ev and others,

I actually moved temporarily to the APRS frequency to figure out what the
non-propagation range of my station is. Tonight or tomorrow morning I'll
move my antenna to the roof (about 10 feet higher but better
omnidirectional characteristics), and return the station to 147.585. For
all interested, my working condx will be:
P2/200, 32 Mb memory, 2x2Gb HD, KPC3+, IC32e (yes-- Euro version), 25 Watt
PA, Comett mobile antenna @ about 100 ft above street level, UI-View 2.32.

17. [propnet] auto-ack, expansion -> Ev

From: Colleen LaPlante <colleenlaplante@mn.mediaone.net>

Rendered body type: text/plain

Ev,
you wanted me to expand a bit on auto-ack. I wasn't the originator of the
suggestion, but here's how I think it works.

By setting messages -> options -> auto answer ON in UI-VIEW, then whenever
someone sees an opening (hearing KB0OBT) they can send my station a message
and the KB0OBT station will auto-ack with my pre-programmed message -
whether I am at the terminal or not!

For VHF contests, I think this is a valid contact.

Note [ROGER], that auto-answer ON is not preserved between sessions in
version 2.32. If you turn it on, then exit UI-VIEW, then restart UI-VIEW
and check, you'll find auto-answer is back off again.

As someone pointed out, you probably want to try this for tropo, Es, and F
contacts, not MS work (to avoid congesting the frequency).

Another contributor seems to have found a way to know that my station
recieved your message without having the auto-ack turned on?

-Bryan KB0OBT
New peeve - people who sent the same message twice - once in clear text and
once with <html><bold>some text</bold></html>.

Hi Ev

Just sent the station a message and watch the results. As you send the
message you will see the number of tries then the results Y | N.

This is Al WB7AJP.
I'm on 53.53 MHz in CN87WL.
I'm located in the East Highlands area in Renton, Washington.
I just started up the beacon today and have heard no one else on.
My Station is:
Rig is an ICOM IC551D with about 80 watts output.
Antenna is a KLM 7 element yagi pointing SW.

> whether I am at the terminal or not!

An interesting behavior of APRSPlus, which I really liked, was the ability
for a message sent to another station to go "dormant" if it didn't receive
an ACK within a certain number of tries.

Once dormant, it would sit in your message box for hours, days or weeks- as
long as you left it there, just waiting for the other station to come back
on the air. Once the other station was seen again, the message began its
transmission attempts again.

The application in BeacoNet is that we could take advantage of these very
short openings, automatically:

Station A sees Station B appear on map and sends a message.
Station B receives the message and attempts Auto Answer transmission
Propagation goes in the toilet, as in the recent reports, and Station B's
Auto Answer to Station A goes dormant
-2 weeks pass-
Station A is heard by Station B again
Station B's AutoAnswer, which was dormant, goes back into action and is
successfully received by Station A

This type of thing could actually make use of errant meteors, weird
short-term propagation, Es, Tropo, and all those other things that cause
open and shut propagation conditions. Imagine a 2m packet meteor QSO that
occurs over several weeks or even months using this method. Slow, but cool.
Not unlike those guys who spent months completing the Trans Atlantic Long
Wave QSO recently.

Rendered body type: text/plain

I would appreciate some information on running the dual port Kam on VHF and
HF using the BEACONet software.
My question is:
Can I run a Beacon on the VHF port and the HF port at the same time?
Right now I'm running on 53.53MHz and would also like to run on 28.128 MHz
at the same time.

The station here is

Rig - ICOM IC 551D 80 Watts
Antenna - 7 Element KLM Yagi at 62 Ft.
Antenna Direction - SouthWest
Elevation - 400 Ft.
Grid CN87WL

Hi Rich,

No stations at all on the map again today but looking through the terminal screen did see the following:

22:21:49R LU3AVO-2>WD4RBX <UI C Len=3>:
~31

Time in UTC. Only lines in the terminal screen that were not my transmissions!

Will leave the system on again for another 24 hours and see what appears. Please let me know if you
have a chance to try a Query.

Bob - KC5DUI - EM26WE

Rendered body type: text/plain

Hi Al,
      I have a KAM plus, which is dual port. I looked into the possibility
of using both ports some time ago, but came to the conclusion that the HF
port is limited to 300 baud on packet (HF Packet). The VHF port is 1200
baud, which is what everyone is using. For Beaconet on 28.128 I connect my
HF radio to the VHF Kam port. I think this limitation may be deliberately
designed in, because as far as I remember data coms has to be limited to
300 baud or lower on all HF bands except 10M.

It would be really nice to be able to use both ports at once. Perhaps there
is a way of making the HF port work at 1200. Maybe someone out there who
knows the KAM better than I do knows of a fix? Another possibility is to
get everyone to change to 300baud packet - at least on 10M!

Al, I put an Azden PCS-7500 on six (53.53 MHz) earlier this week.
Power output is about 50 watts. Antenna is an omni-directional
discone antenna with 0 dB gain. My elevation is 1230 feet.
Doubtful you'll hear me, but if an opening occurs....
Seems we'll have to wait and see what transpires.

I'm only able to answer for UI-View, but yes you can beacon on both the HF
and VHF ports.

The best way to do this, in my opinion, when using UI-View, is to go to the
Comms Setup menu, select 'KISS' from the drop down, click on the Setup
button that appears. Then click on the 'Ka' (for Kantronics) button, and
click on the 'Dual Port' box. Then click 'OK' to put the KAM in KISS mode
using dual ports.

Go to the Station Setup section and put 1,2 in the box marked 'Unproto
Port'. If you are set up as a digipeater, then you will need to set the
system to allow cross digipeating, if that's what you want to do.

This will mean that your beacon will go out on both the VHF and HF port.

If you want to, you can specify different unproto paths for each port. See
the Help file for details, but I don't think that really applies for BEACONet.

Hope that helps de Dave (G0DJA)

Rendered body type: text/plain

This is interesting. For the sake of our newly associated folks, this is
how the logfile below is read:

For 20 minutes (or more...as there was probably a lot of time in the log
prior to 10:09:28), all WD4RBX decoded were his own transmissions.
Nothing else was decoded. (keep reading)

> 10:09:28T WD4RBX>HY1F-15,HOP1-1 <UI C Len=17>:
> [EM84NM] {UIV32}
> 10:14:28T WD4RBX>HY1F-15,HOP1-1 <UI C Len=17>:
> [EM84NM] {UIV32}
> 10:19:27T WD4RBX>HY1F-15,HOP1-1 <UI C Len=17>:
> [EM84NM] {UIV32}
> 10:24:27T WD4RBX>HY1F-15,HOP1-1 <UI C Len=17>:
> [EM84NM] {UIV32}
> 10:29:28T WD4RBX>HY1F-15,HOP1-1 <UI C Len=17>:
> [EM84NM] {UIV32}

Then, KC5DUI appears on the screen! The first decode was a direct
transmission from KC5DUI:

> 10:29:35R KC5DUI>HY1F01-15,HOP1-1 <UI C Len=35>:
> [EM26WE] kc5dui@hotmail.com {UIV32}

Within a (the) second, a second transmission was heard, but this time,
it was WD4RBX's own retransmission of KC5DUI:

> 10:29:36T KC5DUI>HY1F01-15,WD4RBX*,HOP1* <UI C Len=35>:
> [EM26WE] kc5dui@hotmail.com {UIV32}

Notice that, when a Peer class station (n=1 in the config code)
processes a HOPn-N digipeat request, it's own callsign is inserted in
the frame, making the tracing of the propagation path easy.

This went on for another 20 minutes or so:
> 10:34:28T WD4RBX>HY1F-15,HOP1-1 <UI C Len=17>:
> [EM84NM] {UIV32}
> 10:35:34R KC5DUI>HY1F01-15,HOP1-1 <UI C Len=35>:
> [EM26WE] kc5dui@hotmail.com {UIV32}
> 10:35:36T KC5DUI>HY1F01-15,WD4RBX*,HOP1* <UI C Len=35>:
> [EM26WE] kc5dui@hotmail.com {UIV32}
> 10:39:28T WD4RBX>HY1F-15,HOP1-1 <UI C Len=17>:
> [EM84NM] {UIV32}
> 10:41:35R KC5DUI>HY1F01-15,HOP1-1 <UI C Len=35>:
> [EM26WE] kc5dui@hotmail.com {UIV32}
> 10:41:37T KC5DUI>HY1F01-15,WD4RBX*,HOP1* <UI C Len=35>:
> [EM26WE] kc5dui@hotmail.com {UIV32}
> 10:44:28T WD4RBX>HY1F-15,HOP1-1 <UI C Len=17>:
> [EM84NM] {UIV32}
> 10:47:34R KC5DUI>HY1F01-15,HOP1-1 <UI C Len=35>:
> [EM26WE] kc5dui@hotmail.com {UIV32}
> 10:47:35T KC5DUI>HY1F01-15,WD4RBX*,HOP1* <UI C Len=35>:
> [EM26WE] kc5dui@hotmail.com {UIV32}
> 10:49:28T WD4RBX>HY1F-15,HOP1-1 <UI C Len=17>:
> [EM84NM] {UIV32}

> 10:53:35R KC5DUI>HY1F01-15,HOP1-1 <UI C Len=35>:
> [EM26WE] kc5dui@hotmail.com {UIV32}
> 10:53:36T KC5DUI>HY1F01-15,WD4RBX*,HOP1* <UI C Len=35>:
> [EM26WE] kc5dui@hotmail.com {UIV32}

After which, KC5DUI faded away again:

> 10:54:27T WD4RBX>HY1F-15,HOP1-1 <UI C Len=17>:
> [EM84NM] {UIV32}

> [EM84NM] {UIV32}

This is a **great** example of the BEACONet system's power. A short
opening between two specific areas of the country was easily captured
and documented. In this case, it was one way (why? no one knows...maybe
WD4RBX's receiver is hotter, maybe it was just "one way"
propagation...but it wasn't a power advantage...both ran "level F"
[32-63 watts]).

BEACONet works better with more participants...my money says that there
are lots of these types of events (in addition to the long and strong
openings) that occur...it's just a matter of getting a ton of 10-meter
(the HY in the configuration code) participants on the air in order to
plot them.

Quit lurking...join-in on the fun!

hmmmm. It looks like LU3AVO (Argentina!!!) has hard-coded WD4RBX as the
only station through which he wishes to digipeat...and Bob got a
"fractured" frame from him.

Again...for the sake of our new list members...it didn't plot, because
it was missing [GR##ID] information.

If someone got LU3AVO's email from his frame, it would be nice to nudge
him to use HOP1-1 or HOP2-2 instead of WD4RBX, as that would allow any
Peer who received him to digipeat his frame.

Welcome aboard, Al. Be careful with the 7 element beam. At 53-MHz,
it's pattern may be the opposite of what you would expect. You may be
better off with a simple (vertical) dipole. Those beams are usually
quite narrow in bandwidth. 'just a suggestion.

I think that I was talking to Leonardo LU3AVO at that time and you caught a
chunk of it..!

You might want to check setup / miscellaneous and be sure that expire time is
set to 0 "zero." I am quite sure that you RXed my complete beacon. At least 3
times.

Hi Ev,

Interesting results from UI-View when I checked the system this evening. Between 1028 and 1042 UTC
(just checked the clock and it was about 12 seconds slow) I had 54 hits on N8QLT in the format......

10:42:31R N8QLT>HY1F03-15 <UI C Len=9>:
[EN82HL]

According to the Terminal Screen they were broken down as:
    1028 - 9
    1033 - 15
    1037 - 4
    1038 - 13
    1039 - 1
    1040 - 7
    1041 - 2
    1042 - 3

Then at 1203 UTC the Termainal Screen shows the following:

12:03:16R N8QLT>HY1F03-15,HOP1-1 <UI C Len=114>:
>021239z[EN82HL] N8QLT@arrl.net BeacoNet propagation and meteor scatter experiment.
http://go.to/beaconet {UIV23}

Of note is that all this was received on an old 486 notebook connected to a MFJ-1276 TNC and just

monitoring with UI-View V2.36. My rig (Kenwood TS-450S at about 40 watts to a N-S dipole HIGH up at 15 feet) is also connected to another computer running UI-View32 V1.40 and AGWPE using the soundcard to xmit/receive and a Baycom modem for third receive. This computer showed nothing in the Terminal Screen or Map for either the soundcard or Baycom. A couple days ago when I received messages from Rich (WD4RBX) all three received about the same with a slight edge to the Baycom! I didn't change anything with the rig or connections since things were working well, so all settings and volumes have remained the same. Must just be the way things work?

I think I'll try Meteor mode over night and see if anybody can copy me.

Bob - KC5DUI -EM26WE

Hmmm, more cool stuff.

I was running in Meteor Mode on 10m last night, from about 0200 UTC to about
1200 UTC. Looks like Bob snagged some of my beacons overnight, which
surprises me because I have an extremely pitiful 10m station:

HTX-10 showing 20w PEP to a Hamstick mobile magmount antenna on a piece of
metal shelving sitting on the roof of my back porch at about 15'- you can't
get more pitiful than that an still call it a station.

Anyway, the distribution of packets over the 14 minute opening is
interesting, especially the peaks at 1028, 1033 and 1038. What is the best
guess concerning the type of propagation that would account for this data?

Rich

Rendered body type: text/plain

Folks, sad news...and good news.

I work for a K-12 school district in upstate New York. Last night, a
couple of teen agers broke into one of our elementary schools and set a
fire that has closed the school for the remainder of the year. In the
process, they did considerable damage. My team and I will be spending
the next three days doing everything humanly possible to prepare other
schools in the district to take on the sudden influx of displaced
elementary kids.

Yes, this is a sad commentary...but that's not the point of my eMail.

The good news is that ... even though I will be spending the next three
days away, my BECONet "fishing net" has been cast. Try that with SSB,
CW or HSCW!

Though I will be scarce on the list for a few days...my station is

active. Here's looking forward to seeing some DX icons on my screen,
and hoping for much success for all during the eta-Aquarids!

Wow...according to www.spaceweather.com we are seeing 3 rocks per
minute. This is quite significant! I'll be on meteor mode through the
evening on 10-meters (28.128 USB). I'm particularly interested in our
success rate on 10 meters because of the use of USB rather than FM. I'm
fascinated by what effect meteor induced doppler will have on an "SSB
Data" transmission.

I'm ready to try 223.78, too. Anyone want to try for the first 135 cm
BEACONet meteor contact? I don't want to waste time, if no one else
will be on, though.

Hi Bryan,

I assume you picked me up on 2m (I'm running a 10m station too).

I had my beam pointed due south (-6) from here near Detroit, so it was
pointed more toward you than the last time you picked me up (when I was
pointed North). Sorry, I didn't receive your station last night.

This is getting to be a regular thing between our two stations. I have
adjusted my beam to point right at you (-7), and will run in that direction
for the rest of this meteor event- maybe we can get a two-way.

I have also set PASSALL ON to make sure I see everything, and will be
logging each night.

Rich

Hi Bryan,

In last message I used the wrong beam orientation toward you. I see you are
in or near EN35kb, so I'll point that way tonight and the next couple days.

Rich

46. [propnet] BEACONet help!!!

From: ROGER GRANT <grantrc@peoplepc.com>
Date: 4 May 2001 08:47:23 -0700
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-10807-2001.05.04-11.05.18--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have been running BEACONet for several days now, on 2M and 6M, and I have not heard a single thing.
Well, I have heard my own beacon on my 2M mobile radio. I'm pretty sure that I have everything setup
right. I followed the instructions in the QST article. I am using AGWE and sound card as my TNC.
Right now I am just listening on 10M since I do not have any priveleges on that band.

If anyone has any suggestions or would like to try and arrange a contact so I can make sure everything
is all right on this end it would be greatly appreciated.

Chris Grant, KC8PBD
Columbus, Ohio

Until we have a way of knowing where every participant is (and I'm
working on it, by the way <smile>), BEACONet works best with a good omni

(like a 5/8 vertical or 1/2 wave vertical). The reason is easy...you
never know to which direction the band will open. It's entirely
possible that things have opened "behind" you...but by using a
directional antenna, you never knew.

On the other hand...a small beam (4-10 elements) is a good idea for
meteor scatter contacts (at least when the METEORegistry page was
available). For meteor mode, we need all the extra gain we can get.

Just food for thought. Don't dispair...a couple of weeks with little to
show isn't much to make a judgement on. Such is the wonder of
propagation research. :o)

If you want to see if everything is decoding properly...just QSY to your
local APRS frequency and see if you get any icons. If so...then tune
back and let things sit. If not...do your troubleshooting
there...*then* come back to see what you get. Tropo season is building
right now (and will continue through September, at least).

Stick with us...and welcome aboard! :o)

Chris,
It is a method of operating in which each station transmits continuously
for 15 seconds of each minute...listening for the remaining 45 seconds.

We use it during meteor showers (like the one in progress right now).
It's fully described on the web site (http://go.to/BEACONet). Take a
gander there for more info.

Ev, I'm willing to try 222 MHz band for beacons. Only have one
small problem. I can't decide between the ADI/Pryme 222MHz
mobile & Alinco DR-235T mobile. I think the ADI has 5 more watts
output power. The Alinco has 5/10/25 watts output, 219 ~ 220 MHz
capability (see FCC rules) and accepts an internal (Alinco EJ-41U)
TNC. Of the two, which do you prefer and why?

Hi Mark,
The work on 222 is the most experimental of all of our work. Honestly,
the only activity that we ever see is coordinated during meteor
showers. I'd hate to have you go through all of the effort of
establishing a station on that band solely for the purpose of BEACONet
24/7 operation.

On the other hand...we are sorely in need of another type of activity on
2-meters... Hub-class stations. These are stations that are stand-alone
signal sources/digipeaters at altitude. All it takes is a Kantronics
TNC (with ROM 8.2 or above) and a transceiver/antenna (no computer is
needed as the TNC ROM has all the code needed). We really, really need
to try to establish some of these stations around the country. They are
the secret to the long-term success of the network.

So...consider this instead of ramping-up on 222, would you, Mark? It
would go a loooong way in helping the entire community of BEACONet-ers
for a very long time.

As a followup to a previous message, I thought I'd share this snippet
from an unrelated eMail that I recently received:

"I got nothing on 147.585 at all last night. Then again I am antenna
restricted due to living in an apartment."

There are a lot of us that fit this general category. While it's
coolest to know that our personal signal has propagated over hundreds
(thousands) of kilometers, the next best thing is to know that someone
close by may be experiencing an opening.

A and B see eachother.
B and C see eachother.
A and C do not.

This acutally happens quite a bit (and more so as frequency increases,
by the way). Two things can help us to extend our "band opening radar":

1. the use of ",HOP1-1" after the Configuration Code
1a.making sure that we have setup for digipeating (Level-II
   instructions on the web site http://go.to/BEACONet) by
   editing the UI-View.ini file on our home systems.

2. Establishing Hub-class stations (stand-alone stations at altitude)
   that use Kantronics KPC TNC's with ROM 8.2 or above.

We can already do #1 (and #1a). It will be important to establish more
of #2 if BEACONet is to maintain its' success-momentum on the VHF bands
(it's not as important on 10-meters).

Please...find a tall tower, building, hill or mountain to put one up to
serve a large area. It will serve *many* people 24/7. High power is
not a necessity (though it doesn't hurt). The idea is to establish
one in your area...upgrade the power later (but shoot for 25+ watts if
you can now).

Antenna? A simple vertical dipole is best. Why not a "gain" vertical?
because, unless it has been "down tilt" compensated, you may be shooting
over your intended audience. We can discuss this more, if there is an
interest in doing so.

Anyway...please consider establishing a Hub in your area, would you?
Chances are, it is a Hub that will be the first to experience tropo
anyway, giving the others in an area a "heads up" that conditions are
building.

Ev, W2EV

64. [propnet] Clock Sync Epiphany!

Rendered body type: text/plain

I've recently come to the realization of an extremely simple fix to a
nagging problem of clock-creep. The problem is that I don't have the
skill to solve the problem myself and need a pioneering sole to help.

Here's the deal: Clock creep is *usually* caused by Window's inability
to keep time accurately, once the booting process is complete. Windows
gets time from your Real Time Clock *only* at bootup...then maintains
time on it's own from that point on. The more you ask your computer to
do (calculate stuff...render images...HD access, etc) the less time
Windows can spend in assuring that the time it displays is accurate.

Windows ME is appartently notorious for time inaccuracy.

So...what? So *that* is why your 15-second Meteor Mode slot creeps!

Solution? Is there a BEACONet-er somewhere who would be willing to
write a windows-based program that simply resynchronizes Windows-time
with the Real Time Clock periodically? I can't believe that this would
be a big deal in the world of programming, but you never know. I'd like
to post the code to the BEACONet web site for everyone to benefit from.

What say? Any takers?

Ev, W2EV

Rendered body type: text/plain

Ev, I have a KPC-3+ with ROM 8.3. Is a 40 watt station powerful enough
for a hub? Is the KPC-3+ HUB set up information on the web site? Also,
should I use my omni-directional antenna or point my small (3 or 4
element)
two meter beam somewhere, for the HUB?

Elevation here is 1230 feet above sea level. I'm on a "small" hill by
West
Virginia standards. That's WV not western Virginia. The grid square is
EN90rg.

I ran up against this problem of creep and researched it last fall. There
are oodles of clock programs on the internet available for download (many
of them free) that will synch and periodically re-synch your PC's clock to
an internet time standard. They will apparently work fine IF YOUR HAM PC IS
ON THE INTERNET. Mine was not, so they were of no use to me. I don't
remember any names.

If your ham computer is on the internet, do a search with GOOGLE on your
browser and some will probably turn up. Search with words like (clock
download time set), and also visit CNET's download page to look there.

Turns out the solution to MY problem is GPS-based. As soon as I add a
cheapie GPS I can set the PC time periodically from the GPS time. An old
refurbished TRIPMATE GPS can be had for $50 from DeLorme last time I
looked, but I haven't bought yet. The TRIPMATE will require modifications
to work properly. Some of the software I have already installed will
handle interfacing to the GPS and automatically set/reset the clock (not
sure, but perhaps it is UI-VIEW that has this GPS time feature).

I've done the searches, and found the systems that you describe (Internet based syncronization, GPS based, etc.). I've found, though...the problem is with Windows...not the real time clock. If comeone could code-up a little program that simply told windows to check the RTC every n-minutes, I think we'd have a winner of a product.

Maybe not...but so far, each time I boot-up my computer the time is aligned with WWV...but after a couple of hours, it's off by as much as 20-seconds (not good when we're dealing with 15-second windows in meteor mode).

Rendered body type: text/plain

Hi Mark,
The "secret" of setting up a Hub is finding a spot that is high, relative to the rest of the topology in the area. Your 1230 feet would be perfect in my part of Western New York...but I have a feeling it's not so high in W.Va. :o)

If you can find a high location...certainly 40-watts will do the job. If you can't, then put your efforts into your own station, and see if someone in your area can later come up with something good and high. :o)

I'll be pointing your way overnight tonight...with the hopes of burning up a meteor or two.

Hi Ev et all...
I use d4time myself, and you can set it to check at any interval you

desire, as long as youre connected to the net. I likewise, have a pentium
90 that likes to wander about 3 seconds an hour. The added advantage of D4
is it gives you a choice of multiple time servers, and formats to set your
system clock with. (UDP, SNTP, TCP), You can get it here among other
places: http://ftp.uevora.pt/pub/windows/Utils/d4time/

      Never heard of anybody trying this, and it sounds like it might be
pretty difficult. You already know what I do instead -- connect the GPS
and have UI-View32 sync the clock to the GPS once a minute.

Ev,
There is a program called 'Atom Time' from Naisson Inc. It links to the
atomic clock in Boulder CO. The program calls the URL at a set time
determined by the user and resets the internal clock in windows. You can get
it from the following URL:
www.atomtime.com

Hope this helps,
george :-)

Subject: [propnet] Clock Sync Epiphany!

I've recently come to the realization of an extremely simple fix to a
nagging problem of clock-creep. The problem is that I don't have the
skill to solve the problem myself and need a pioneering sole to help.

Here's the deal: Clock creep is *usually* caused by Window's inability
to keep time accurately, once the booting process is complete. Windows
gets time from your Real Time Clock *only* at bootup...then maintains
time on it's own from that point on. The more you ask your computer to
do (calculate stuff...render images...HD access, etc) the less time
Windows can spend in assuring that the time it displays is accurate.

Windows ME is appartently notorious for time inaccuracy.

So...what? So *that* is why your 15-second Meteor Mode slot creeps!

Solution? Is there a BEACONet-er somewhere who would be willing to
write a windows-based program that simply resynchronizes Windows-time
with the Real Time Clock periodically? I can't believe that this would
be a big deal in the world of programming, but you never know. I'd like
to post the code to the BEACONet web site for everyone to benefit from.

What say? Any takers?

Ev, W2EV

Thanks, George. I keep thinking how simple the solution is, though. No
Internet or GPS needed...just a "shim" to have Windows look at the RTC
more often than just at startup. It seems relatively straightforward.
Unfortunately, I program in BASIC...not VB. :o)

I can see it in my minds' eye...but don't have the skill to code-up the
proposed solution. Any programers out there that can straighten me
out? Maybe I'm all wet! :o)

Doug,
It's great to have you on-board from Seattle! I'll be looking for you
from the East Coast.

Warmly,
Ev, W2EV

Ev,

I don't think that periodic resyncing of Windows time to the computer Real Time Clock will accomplish your goal. I have six computers running here at the house and all of them vary as to time even when they are re-booted. The problem is that the PC RTC circuit is controlled by a free-running oscillator on the PC motherboard which is relatively stable but not nearly accurate enough to maintain correct time over a long period.

A few years back, I ran across an ad in QST from a company called Acron-Zeit (now advertising as Atomic Time, Inc.). They were offering a desk-top "Atomic" desk clock (modern arch shaped case) which contained a receiver set to WWVB in Bolder, Co. This particular unit had a PC interface that connected to a PC Com port. Windows software was supplied which started at boot and would update the RTC and Windows time at user-selected intervals.

I set the clock up on my file server PC which runs all the time and placed batch files in each of my other PCs to access the time from the File Server when they are booted up. I also set the Windows Scheduler to run the batch file periodically to keep the time synched to the File Server time. It has been working well for me.

I have checked the Atomic Time web site, and they are no longer advertising the Desktop Clock with the PC interface. They may still have some in stock, however. It might not hurt to check with them. Their toll free number is 1 800 985 8463, and their web site is www.atomictime.com.

I will be looking around for other "Atomic" clocks with PC interfaces and will pass the word if I locate any.

The other method would be to extract the time from a GPS receiver and use it to update Windows time. It might be possible to extract the time from a GPS position string, and use the DOS "TIME" command to set the RTC, but I am not sure how it could be sent to Windows to set its time. Any Windows programmers out there who might know if it could be done with Visual Basic?

Just a thought.

Great points, Joe. Maybe I need to study things more closely. I did a google search on "Real Time Clock" and found a company that sells a board that is accurate to within seconds per month, and a company that sells software that somehow compensates (http://www.rightime.com).

I guess I've got more poking around to do.

Great resources that you referenced, by the way. Thanks for sharing the
extra research!

Regards,
Ev

Ev,

More info on the Desktop Clock.

I checked an alternate web site for Atomic Clock, www.arctime.com,
and found the desktop clock I have. Go to the site, clicl on
"Desktop Clocks" in the frame on the left side of the page and
look for Item 17.

It comes with the PC cable and the Windows software.

Ev and others

Actually setting the windows clock from Visual Basic or Delphi for that
matter is really a piece of cake. The problem I see is that the computers
RTC is not all that accurate. The accuracy of the RTC is dependent upon how
stable the free running oscillator on the mother board is. The RTC on my
homebrew, Heinz-57, junkbox throw together appears to be more accurate with
WinBlows 98SE than my wife's Big named IBM with SE.

I use Dimension 4 on both machines to keep the clock updated. I also have a
broadband internet connection so I update about every half hour or so and I
find the IBM drifts more that than the throw together.

I will look into a windows program using VB or Delphi that will set the
Windows clock with the DOS clock and report back in a few days.

My 28.128 beacon is off the air until I can discover what the idiot
satellite dish installed did on my roof to induce TVI all over my house.
Did not have this problem until he installed the dish. Anyone have one of
those TURK400 broadcast TV antennas hooked to their dish and are you having
trouble with H.F. getting into the TV?

I have a Kantronics TNC but it does not have ROM 8.2. Is it possible
to upgrade my TNC?

>Please...find a tall tower, building, hill or mountain to put one up to

I am up on a hilltop and had my radio and TNC turned on overnight but
received no packets on 147.585.

>Antenna? A simple vertical dipole is best. Why not a "gain" vertical?
>because, unless it has been "down tilt" compensated, you may be shooting

>interest in doing so.

I have a 5/8 l vertical antenna which I recently used to contact a

station about 250 miles from me via a repeater about 150 miles from
me.

Rendered body type: text/plain

Does anyone have a URL for a low price GPS which does nothing except
send the current coordinates and time to a computer. I don't need
features like a fancy screen or mapping or tracking built into the
GPS.

Rendered body type: text/plain

I've just tried several times to install UI-View on my Win 2K Server - each
time the install shield hangs. On the first try I got through the
registration instructions and was left with the install shield blank
screen. The subsequent attempts hang at the install shield 99% complete
screen.

I've halted the application with Task Manager to clear the hung
application.

Any Ideas?

Thanks - k4MFW - Michael

A Garmin GPS45XL would do what you need. It has an adjustable antenna,
simple features, weatherproof, etc. No mapping program except for the
"etch-a-sketch" style map it draws when you move...

Hello!

I am new to the list and was wondering if I
could get some help getting started. I wanted
to use the sound card in my PC (running Windows
Me), with Rigblaster, and an IC-756 for 6 and 10
meter operation. I don't have a TNC.

Unfortunately, I have never set up or used any
software-based programs for the digital modes,
and I am a real novice when it comes to this
kind of stuff. Is there anyone on the list who
may be able to help as I try to work my way
through the installation and setup processes for
Rigblaster and then the other programs I will
need to participate? I would like to let
everything run pretty much 24/7 when I get it to
work.

Thanks in advance and 73,

Hi,
good catch. Success requires attention to detail at both receiver and
transmitter for this BeacoNet endevor.
Anyway, i wanted to comment to Ev why i used CQ-# instead of the beaconet
configuration unproto address. i found that a TH-D7a (not the G upgrade
version) responds as follows :

transmitted unproto	thd7a response
APRS	" ?? callsign "
CQ	" ?? callsign "
VK1l32-3	nothing

Packets transmitted using UIview don't get completely decoded using the
unproto addresses above on a receiving THD7a in APRS mode. The unmodified
THd7a decodes packets fine on the 144.390 frequency. i presume this is an
effect of the "a" version. When i am confident my packets are getting out
in receivable form, i will change to the coded VK1l32-3 address. perhaps i
don't have the HT setup correctly?

Respectively submitted,

Wm Seffens

Hi Ev and All,
Sri I forgot to mention the band. It was 2m, 147.585. The grid squares where

KG4EYO=EM73PR, Mine FM19xo. Distance of 629.4 miles. I saved a screen shotof
it if your interested.

See if the refurbed TRIPMATE is still available at DeLorme's website. It
was $50 a few months ago. It needs mods or a modified cable to make it work
without DeLorme's software. The mods are on the internet.

Rendered body type: text/plain

Hello, All,

A W3NRG beacon is now active
on 147.585 mh from the San Diego,
CA area. The identifiers are:

     grid: DM12JQ

     configuration: VK1FA3-0

While the antenna is omnidirectional, the
reflections from surrounding buildings
make the direction of transmission and
reception largely toward the north and east
from Coronado, CA. In duplex mode,
the station consistantly communicates
with repeaters in San Diego, Imperial
and southern Orange Counties.

So far, I have seen no other stations on
the frequency. I would appreciate feedback
from anyone logging this beacon.

I have just activated a 53.530 beacon at Level 1. Location EL98HP, 50
watts to Ringo Ranger at 20 feet above average terrain. I will try to
have it on every evening and all weekends, barring thunderstorms and
interference to my 6 meter ssb operation. We have had some nice Sporadic
E openings to the midwest the last two nights so listen up!

Drop me a line if you are listening on 6.

Thanks
Jim Diggs

I have done some testing with both my Windows 98SE computers and both have
the same results. If you set the clock in windows, it does update the DOS
clock and the BIOS clock.Likewise, if you update the BIOS clock, DOS and
Windows are also updated. The Real Time Clock (RTC) on the mother board
keep the BIOS clock running. You can set this clock by going into the BIOS
setup when the computer first starts.

Therefore, A program to update the Windows Clock using DOS or BIOS as a
reference is really not a player. The reason some clocks 'slip' is because
of the accuracy of the onboard RTC and the 'load' on windows. There are
some programs that crunch data or do garbage collection and do not give
priority to anything else. This may cause the RTC to 'skip a few beats'.

The only accurate way I know of to keep the computer clock accurate is to
base it against some sort of time standard such as an internet time server,
WWV, or GPS.

The desktop clocks that are sync'd against WWVH and WWVB that have a
computer interface seem to be the cheap way to go for those who do not have
a full-time connection to the internet.

Sorry for the delay. Here's the info on that clock from the shack.
I don't recall where I initially located this on the web.

-
****
Mark   N8UVQ@juno.com
****
--------- Begin forwarded message ----------

By using your LF receicer and free, downloadable software from the
Radio Clock web site (http://sapp.telepac.pt/coaa/radioclock.htm),
you can turn your PC into a super accurate clock, according to
Bev Ewen-Smith, developer of the program. In addition to WWVB,
European readers can use the software to decode the following
time signals: MSF/60kHz (Rugby, England), HBG/75 kHz (Prangins,
Switzerland), and DCF77/77.5 kHz (Mainflingen, Germany). It will
also work with some Hf time stations located outside the U.S.A.
Full details are given on the company's web site.

Radio Clock requires a PC with Windows 95/98, a 16-bit sound card
that supports 8k samples, and a frequency stable receiver with
USB/LSB or CW operation.

Just checked out this PC Clock program and it's not a bad program, although
it requires a registration fee of $29.95 to enable the feature of
automatically setting the PC clock. You will also need a second sound card
if you plan on running this software in conjunction with other software that
using a sound card.

If you don't have one of those Radio Shack clocks that receives WWVB/WWVH
then any old table top SW receiver that receives WWV on 5, 10, or 15 MHZ
will do. I checked it with the HF rig on 10 MHZ and also an old Sangen
ATS-810 (my trusty little SW receiver from my Desert Storm Days) and it
worked great except for the front-end overload from the HF rig.

Hi Group,
This is what I've done:

The Windows ME (Tyan main logic board, btw) system has been running for
three full days. The Windows Clock (in the system tray) was slow by
some 20-seconds (compared to WWV announced time).

I shut down and restarted.

I checked my Windows Clock again, and the system was 4 seconds fast. (a
total swing of 24 seconds)

I then reset the time and will wait until tonight to re-try the
experiment.

Interesting.

Ev, W2EV

106. [propnet] 6 Meter BEACONet Antenna Issues

From: "E. Tupis (W2EV)" <w2ev@arrl.net>
Date: Mon, 07 May 2001 22:17:29 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-11521-2001.05.07-21.33.59--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm truly stumped as to our overall lack of success on 6 meters so
far...that is, until it dawned on me that the 6-meter advantage is also
a 6 meter disadvantage. Here's the scoop...

6-meters is a prime BEACONet band for one major reason...the 53.53 MHz
BEACONet frequency is farther away from the SSB/CW sub-band than on any
other amateur band...as a function of percent-of-frequency. This is a
major advantage, because it allows BEACONet-ers to operate both BEACONet
on 53.53 MHz at the same time as they chase DX on 50.2 MHz SSB...with
little/no self interference. This also allows Rovers to operate
BEACONet for the same reason...there is little or no adverse impact on
their SSB/CW operation.

The other side of the coin is that the typical antenna used for SSB/CW
operation is *very* poorly tuned at 53.53 MHz! Radiation patterns of
beam antennas can actually be reversed due to the mismatch.

If you are a 6-meter BEACONet-er, please take a moment to consider using
a simple vertical dipole (or the MFJ 2-meter 5/8 over 5/8), or even
finding an old 6-meter beam -- repruning the driven element and using it
by itself (no reflector/directors). I have a feeling that a lot of us
are simply using untuned antenna systems out of simple ignorance (I'm
one of them, by the way...but have just switched to the MFJ mentioned
above...and am getting an excellent SWR now).

Even a simple inverted Vee, tuned to 53.53 is better than an expensive
high performance beam cut to SSB. Food for thought.

Ev, W2EV

Ev - On the other hand many commercially available 6m verticals are cut
primarily for the FM portion of the band (52 to 54) and usually go to
pot on SSB/CW low end of things. The Diamond's, Comet's and Ringo's are
good for the 52-53+ and some (Diamond V2000 tribander) will have a
tunable counterpoise for 6m that may allow peaking from about 51 to 54.

Another good vertical option would be a ridged or "rollup" J-pole - lots
of plans, kits and designers available in the net (check K4ABT "Buck"
Rogers site at: http://www.packetradio.com/jpol.htm for handy calculator
and http://www.packetradio.com/ant.htm for general info.) Also
http://www.mycal.net/projects/mpr/jpole.htm and
http://archimedes.galilei.com/raiar/cactus.html   Plenty of other
sources if you do search on J-poles. See
http://www.jadeprod.com/jadepole.html (Jade Products) for inexpensive
ladder line kits - no connection to Jade, etc., etc.)

"Plumber's Delight" and "Copper Cactus" would do well for 53.53, or
147.585 for that matter, and relatively inexpensive and easy to build
out of common materials. Can go with EMT conduit or copper pipe
depending on equipment (i.e., torch heat), available materials and
desired strength.

109. [propnet] Re: Up on BEACONet

From: "E. Tupis (W2EV)" <w2ev@arrl.net>
Date: Tue, 08 May 2001 06:53:39 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-11568-2001.05.08-06.10.08--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The note below is a snippet from an eMail that I received directly, and
decided to reply to to the listserve because I thought that it asked
questions that would be of interest to other/future BEACONet-ers. The
personal stuff has been snipped.

> ... I now have a 2 meter BEACONet station running at the home QTH.

> It is low power (5w) and beaming to the southwest, but that's
> the best I can do for now. More power and an omnidirectional
> antenna are planned.

Hi Terry,
Given your power output, you may want to add a feature to your system
(easy to do, actually), to allow you to extend your reach once other
stations come on-line within range. It's called HOPn-N digipeating.

If you're using UI-View in KISS mode, then you are activated for it
yourself. Here's what you do:

Right next to your Configuration Code, put the following: ",HOP1-1".
This will be a "request" for any Peer/Hub class station to digipeat your
transmission once. This will allow your station to be heard at greater
distances for now...until you can get higher power for yourself.

As time goes by, more and more people will setup Hub-class stations (see
the QST text in the sidebar for information on establishing a Hub-class
station for more information). In the mean time...there's nothing wrong
with fishing for them now. It can serve as an excellent "heads up" for
others if/when the band opens.

For instance: A sees B, B sees C, but A is oblivious to C. B, in this
case is a Hub. By including ",HOP1-1" after their configuration code,
all three see each other (it's a "community" thing <g>).

>From what I can tell, you are the only person active in your area, but
I'm about to establish an Internet-link that will let us "connect" to
see who else is out there while the bands are flat. Be sure to
subscribe to the PropNET/BEACONet eMail listserve (in the light blue at
the top of the web site of http://go.to/BEACONet -or-
http://www.rochesterny.org/BEACONet). I'll be talking about it there in
the next couple of weeks.

> For the Rover station I'm thinking GPS tigertrackers on 2
> and/or 6 meters, with omnidirectional antennas. I know how
> to set up to send the LAT/LONG, but changing the grid square
> would be difficult without reprogramming at each new location.

As for the tigertrack, it is an excellent choice. You set it up exactly
as you would for APRS, with just a couple of exceptions:
1. Instead of using the Configuration Code, you use GPSLP. Doing
   so will cause BEACONet-ers to display a "Little Puppy" icon when
   they decode your transmission (a Rover...get it?) :o)
2. When you are operating as a Rover in a contest...
   ...you must *exclude* ",HOP1-1" from your unproto (because most
      contests don't allow the relaying of signals)
   ...you should include ",RFONLY" in your unproto path. This is
      a command that instructs GATE-class stations to *not* send
      your signal/position along to the "other side" of the GATE
      (same reason as above)

I haven't really spent a lot of time on Rover-class issues yet, as it is
important to get a lot of home stations active and "fishing" for
propagation to see much success. I figured that the Rover issue would
be something that I'd cover in a QST article next year...but there's no
reason to wait, if you're inclined to power up as a Rover. :o)

It is nice to have your signal on the band. I'm looking forward to the
Tropo season kicking in. We are just far enough away (FN21 to FN03)
that we won't see each other on a day-to-day basis, but may see each
other from time to time due to tropo.

Welcome aboard!

Regards,
Ev Tupis, W2EV [FN03XD]

ps...no Dayton for me this year, I'm afraid. I've been blessed with
twin boys (Rubrick and Rupert) ... (ok...just kidding...Ethan and
Spencer <g>) (now 17 months old) and I'd hate to leave mom with her
hands full while I play for the week :o). She's already quite a sport
when it comes to the microwave cumulative contests in the late summer
(in which I'll be using a Rover BEACONet system myself, by the way).

Hi all, I ran across an interesting propagation forecasting program at:

http://www.qsl.net/w6elprop

In order to use this program the solar flux and K index are needed.

Anybody know of a web based source for this?

Thanks, Dale

W6ELprop is a very nice program.  It is a Windows version of the old
Miniprop Plus.  I especially like the frequency map for predicting MUF for
anyplace on the globe.

Earl - been out of pocket most of last couple of weeks but wanted to let
you know I must have the old 1270 TNC humming OK.  Was able to hit the
digi on the ISS last week a couple of times on one pass.  Like to fell
out of my chair when it bounced back to me.   Was at about 50 degrees
elevation at the time so that says something about the vertical pattern
of the tri-band Diamond - hihi.   Also have "new" 1274 at PO I need to
pickup tomorrow and I'll be able to use KISS and will try to set up as
Level 2 for BeacoNet.

      Sounds great, Bruce! I haven't tried to go through the ISS digi for
a few weeks, been running too fast to and from work! going to work at 6 AM
and getting done at 2:20 PM sort of puts a damper on things. :-(

      I'm operating mainly on 144.39, although I also have a 10-watt rig
running regular APRS on 53.530 all the time. always hoping to get
something in her on 6, but never yet. Oh well...

      Keep up the good work, Bruce!

Rendered body type: text/plain

I'm a busy person so don't have too much time for research. I have a Radio Shack HTX-10, 25 watt
tranceiver I have dedicated to the BEACONet project.

I need to interface the mic. jack to the Kantronics KPC-3 plus I have. Does anyone have advice on the
connection???

I have found that if the mic. is unpluged something inside the RS box opens and I can't control squelch
or SSB funtions ??

Help very much welcomed!!

Rendered body type: text/plain

Hi Don,
I was with you until I read about your loss of rig control with the mic
unplugged. I've dropped the author of http://www.packetradio.com an
eMail to ask about the rig to see if there's something special about it
(any gotcha's). I'll let you know what the response is.

In the mean time, hit his website (cited above) for wiring diagrams for
all sorts of transceiver/TNC combinations (except HTX-10 to KPC3).
There, you will see the pinouts for the HTX-10 mic plug and the KPC3
DB-connector. You should be able to figure out the connections based on
that.

In the mean time, stand by to see if/what response I get to my inquiry.

Ev, W2EV

BTW...there *is* a SoundCard to HTX-10 cable shown on his site, and it
doesn't seem to have any special electronics associated to make it work.

:Product: Report of Solar-Geophysical Activity
:Issued: 2001 May 09 2210 UT
Prepared jointly by the U.S. Dept. of Commerce, NOAA,
#Space Environment Center and the U.S. Air Force.
#
Joint USAF/NOAA Report of Solar and Geophysical Activity
SDF Number 129 Issued at 2200Z on 09 May 2001
IA. Analysis of Solar Active Regions and Activity from 08/2100Z
to 09/2100Z: Solar activity was low during the past 24 hours. Region
9445 (N25W67) produced both of today's C1/Sf flares, the first at
0603 UTC and the second at 0853 UTC. The other active regions on the
disk were quiet and stable. A new region emerged at S08W28 and was
assigned as Region 9453.
IB. Solar Activity Forecast: Solar activity is expected to be
predominantly low during the next three days. There is a slight
chance, however, for an isolated M-class event from Region 9445.
IIA. Geophysical Activity Summary 08/2100Z to 09/2100Z:
The geomagnetic field ranged from unsettled to minor storm levels
during the past 24 hours. Enhanced solar wind velocity, and periods
of sustained southward solar wind magnetic field orientation led to
an increase in geomagnetic activity. The plasma and field parameters
appear to be consistent with the passage of an interplanetary
transient. Minor storm periods were observed from 0000-0600 UTC, and
active conditions dominated most of the remainder of the day. The
greater than 10 MeV proton event that began at 07/1915 UTC ended at
08/1935 UTC. The peak of the event was 30 pfu at 08/0755 UTC. The
greater than 2 MeV electron fluxes attained high levels briefly
during the past 24 hours.
IIB. Geophysical Activity Forecast: The geomagnetic field is
expected to be unsettled to slightly active during the next 12-24
hours as the current disturbance is likely to persist. Predominantly
unsettled levels are expected to prevail during the second and third
days.
III. Event Probabilities 10 May-12 May
Class M   20/15/15
Class X   01/01/01
Proton   01/01/01
PCAF   green
IV. Penticton 10.7 cm Flux
Observed   09 May 129
Predicted   10 May-12 May 125/120/115
90 Day Mean   09 May 168
V. Geomagnetic A Indices
Observed Afr/Ap 08 May 016/014
Estimated Afr/Ap 09 May 028/035
Predicted Afr/Ap 10 May-12 May 015/015-010/010-010/010
VI. Geomagnetic Activity Probabilities 10 May-12 May
A. Middle Latitudes
Active   30/25/25
Minor storm   25/20/20
Major-severe storm   15/10/10
B. High Latitudes
Active   30/20/30
Minor storm   25/15/15
Major-severe storm   20/15/10

>Does anyone else here receive the obnoxious carrier on 28.130? It shows up
>here about the time the grey line passes and sticks around most of the
>day. Gives me a horrible 2500 hz tone on 28.128 upper.

Try switching things off around the house. My KAM+ gives various signals on
50MHz (one on the CT0WW frequency of 50.030MHz) and I have noticed signals
on various bands from Videos, Frequency counters, PC Screens and PCs. A
friend of mine found signals from new washing machines and, of course in
Industry, there are ARFA (Air, Radio Frequency Assisted) ovens,

thermoplastic sealers and driers on 27MHz that can be heard on 28MHz as
well......

Then you have to spot the signals from your neighbours and any local
electronic equipment. Over here more and more shops are getting equipment
for selling Lottery tickets and other EPOS equipment. Some of which is none
too quiet on the bands!

Then there's the bank 'hole in the wall' machines. These are poping up at
shops, petrol stations and even just walls. HI! Driving past those even
with 144MHz switched on shows that there is RF polution being kicked out by
them.

Oh, and just wait until Internet access via Power Line Carrier starts to
catch on.......

De Dave (G0DJA)

Hi Doug

I had one on 28.128. It turned out to be one of my VCRs it now stays

unplugged till I need it. The tone was constant.

Hi Ev,

Just wanted to let you know my beacon will be off the air for a couple days. WX forecast is for
possible thunderstorms Thursday and Friday so pulled the plug this morning. Will bring it back up when
the forecast is clearer.

Bob - KC5DUI - EM26WE

130. [propnet] Confirming UI-View System Setup

From: esack <esack@pacbell.net>
Date: Thu, 10 May 2001 11:05:58 -0700
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-11997-2001.05.10-13.22.28--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi, Ev,

I tried my idea of giving the TNC
a temporary (experimental) "false" coordinate address and
then receiving on and recording the beacon transmission
from a remote (my 2M handheld) receiver in order to confirm
that the UI-View was properly detecting,
recording and displaying the "stated" signal
coordinates on the USA map.

I just used a cheap Realistic tape recorder
to record the broadcast beacon signal
with the signal being recorded through
the built in microphone on the recorder rather than
through a direct audio input connection
(which that recorder does not have.)

When I sent the so-recorded beacon signal
back to the TNC through its audio input
cable and watched for the report on the
UI-View Terminal screen,
the new temporary ("experimental") location was duly
received and the Icon for my station moved to the
(experimental) new location on the map.

Of course, I then immediately put the coordinates back to
"true" so as to avoid further transmitting a
"false" signal.

Great way to confirm that the BEACONet
set up is working.

Now, to get some more stations on
for BEACONet in Southern California.

I had a short burst of noise on my 6-meter rig just now. It could
have been anything, but being the optimistic sort, I immediately went into
meteor mode, and will remain in meteor mode for a while, probably most of
the evening.

Anyone else hear anything going on on 53.530?

Rendered body type: text/plain

Greetings,
       I just joined this mail list so here is my first posting. In
fact, its a BEACONet success on 6 meters! On Monday night (05/07/2001),
from about 20:15 to 21:15, I was copying packets from Jim, K4AHO in the
state of Florida. His grid is EL98HP and I was setup as a class I
station when I noticed that the receive led on my Kantronics KPC-3 Plus
was showing activity! I quickly installed UIVIEW and had K4AHO on my map
(now operating as Class II in KISS mode). I got interested in this
project after reading Ev's inspiring article in this month's QST
magazine. My station is an Azden PCS-7800H running 50 watts into a Comet
GP-15 tribander up on the roof about 30 ft. I use a Diamond triplexor so
that I can operate 3 different radios/bands on the same antenna and
single Beldon 8214 coax feed. I am also found on APRS on 144.39 MHz and
70 CM FM with this setup. This is a great project so if you are on 6
meters (53.53 MHz), please look for my BEACONet signal. I am also trying
10 meter and 2 meter BEACONet out too but my 6 meter station will be a
little more dedicated. I have already copied KC5DUI there (hi Bob) who
looks to be a local station for me on 10 meters. See ya on the map!

Considering the indexes anything is possible!

HF is a disaster.

VHF is a wide open mess.

136. [propnet] AR-6 Tuning

From: Jim Diggs <jimdiggs@mpinet.net>
Date: Thu, 10 May 2001 21:54:28 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-12077-2001.05.10-21.19.47--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Had an interesting experience tuning a Cushcraft AR-6 this past
Saturday. I was trying to tune it using a new Autek Research RF-5
Anylst. I was tuning withoutthe instruction sheet andwas having many
problems. Then I found the RF-5 had crapped out so I was forced to fall
back to using the Azden 7500 and a SWR bridge. I fouind a setting I
liked at 102 inches total length and a very low SWR. But something told
me this wasn't correct. I went on the internet and found the instruction
sheet for the AR-6 and it called out for 106 inches at 53 Mhz. I marked
the present position (102 inches) and reset the length for 106. I found
if I stretched the matching bar as far around the loop I could get, the
AR-6 gave me a good SWR from 52.5 to 53.53. It is clear that the
antenna lenght and match bar location interact. I think the best results
can be had by following the length chart in the instruction manual and
simple tuning the match bar for best swr. and Yes at 53.53 it was almost
at the end of it's reach.
The antenna seemed to work very well for a change. I heard and was heard
by W8DQ and N0ALJ.

By the way according to the books 35 feet height is optimal for 6 meter
Sporadic E.

Rendered body type: text/plain

I think there may be other issues that will effect the slow update of the 6 meter effort. I've been a ham since 1953 and pioneered Packet Radio in the Central Florida area in 84/85. I have been active on 6 for only about 1 1/2 yrs but I can tell you this. 6 meters takes a lot of patience to understand the secrets of the "Magic Band" propagation. For example, one of the best indicators for me that the band is warming up is a drop in local power line noise, Not always but when the Band is OPEN is noise is always very low. FM does not give a good indication of band condition to the ear. Also I don't think that Beaconet has caught on with the diehard 6 meter enthusiast, nor is it likely to.. These guys are not so interested in technology as making the contact. Their ears are the best indication of band condition. If they do look for a beacon then they will tune down in frequency. Unfortunately the trend with 6 meter beacons is that with low power and low, omnidirection antennas you can heard the beacons only when the band is really hot. By then it is obvious to any one with a wet noodle for an antenna (AR-6) that the band is OPEN! I think the real success will be if Beaconet is combined (collocated) with some REAL Beacons running power (at least 100 watts) and stacked omnidirection antennas. Maybe even a PSK-31 beacon located in the CW band working like a combined CW and Beaconet Beacon. I have also noticed that sometimes the Sporadic E propagation favors a small area and moves very quickly. Monday night I was hearing and working many stations in the Chicago and Oklahoma area. Two separate clouds doing their own thing. It will take many more 6 meter Beaconet beacons to make this useful on 6. I think we can gain from the lessons learned and methods of the NCDF/IARU Automated Beacon system. Go to Http:www.ncdxf.org/beacon to see what I mean. Better still, listen to 14,100, 18.110, 21.150, 24.390, or 28.200 to see what a beacon system can do.

Sure enough. That's what makes BEACONet such a cool application for
this band in particular.

Additionally...

> I think the real success will be if Beaconet is combined
> (collocated) with some REAL Beacons running power (at least
> 100 watts) and
> stacked omnidirection antennas.

That's the idea behind Hub-class stations (those are Level-I
Kantronics-based stations with high power and good elevation). Long
term success (beyond this year-long experiment) is really predicated on
the establishment of at least one Hub in each metropolitan area.

> Maybe even a PSK-31 beacon located in the CW
> band working like a combined CW and Beaconet Beacon.

This is the next frontier for BEACONet. There are a group of folks
ramping up right now for a transatlantic 2-meter BEACONet^31 attempt.

and finally...

> I have also noticed
> that sometimes the Sporadic E propagation favors a small area
> and moves very
> quickly.

And this is precisely why we need more 24/7 stations (Hubs) scattered
around. The higher one goes in frequency, the more narrow the geography
of a propagational path. We need to get to a critical volume of
participants to see more successes. If each grid had a Hub, we would
have the makings of an unparalleled propagation monitoring system!

Excellent comments, Jim. Let's see how far we can take BEACONet this
year. Let's see how many Hub's we can establish!

Rendered body type: text/plain

Jim is correct in many of his statements about the magic band and the
diehard magic band ops (admit I am chasing my WAS). Have thought a lot
about the PSK mode and 6M BeacoNet. I don't think PSK is allowed in CW
part (50-50.1) in US - it is in other countries, Japan for one.   Only
reference I have seen about beacons on 6 (at least unattended ones on
low end) is they are restricted to 50.6 to 50.8 either by reg or band
plan or both???   Might look for a spot well above the normal PSK slot
of 50.290 - maybe around 50.35 +/- or so. Have not spent a lot of time
listening in that area but have parked on the 50.4 AM calling freq and
yet to hear any AM activity in my area (Central Mississippi).

 I think I mentioned to Ev the possibility of running PSK on FM. Group
in Hawaii have used PSK on 2m and 440 FM with good results and excellent
S/N (see QST, Oct, 2000, page 81 under Technical Correspondence by
Butch Mason, W6KAG) That might be tried on the upper end of 6. Anyone
else tried it?

As one of the first contacts I made on 6 told me and I find it true, "if
the band is open you could use a wet noodle!" The stacked or single
omni (inverted Vee or loop) would probably do fine. Monday night was
indeed weird. Worked several Maryland and NC stations but they came and
went remarkable fast - blow you out of the chair one minute and total
unreadable the next and then back strong again.

Hi Dave and the group, yes this helps. I have been learning how to use the interesting propagation program at:
http://www.qsl.net/w6elprop and was wondering why it was saying only 40 and 80 meters where open to the places I checked.

 >Solar Activity Forecast: Solar activity is expected to be predominantly low during the next three days.

There is also a good web source for solar flux index and the K index at:
http://oh2aq.kolumbus.com/dxs/wwv25.html (needed by the program above)

And don't forget WWV if you are portable and do not have internet access.

CUL, Dale kf4sir

Rendered body type: text/plain

Seems to me that the problem with slow introduction of BEACONet to six might be this:

I don't have a rig and antenna to commit to an experiment. Six-meter FM rigs aren't too common; I had to do some research to find out what exists. Many folks have a spare 2m fm rig they can use to listen and see if there's any activity, but when I started thinking about using my main HF+6 rig, problems about antenna switching, TNC connection etc immediately came up.

So today, I'm listening on 53.53 as I work; if I hear any packet at all I'll look into making another cable for the TNC.

So far, all I can hear on 2m is Ed W3NRG, and he can't hear me.

73

There are lots of potiential 6 m FM rigs out there. Check on any of the older low band drawer units from GE (Delta, Rangr, Exec II, MASTR II etc) and Motorola equals. You will find them running from about 40 to 100+ watts out. Can typically pick one up for well under 100 dollars if you shop around. Lots of info on converting them to 6m - some simple - some not so simple. Lots of info on many web sites and also info on setting them up for packet.

Hello BEACONetters,

One suggestion for a 6 meter antenna that is cheap and easy to construct
and tune is a copper pipe J-pole. Basic plans with the formulas to
obtain the dimensions are in the ARRL Handbook. There is also a
construction diagram for a 51MHz version on K4ABT's web site:

http://www.sedan.org/ant.htm

along with the formulas to use for any frequency so it would be easy to
adapt to 53.53MHz. Just scroll down to the correct link. You might also
check out the plans for the Copper Cactus. This is a multi-band version
where the total verticle length is for the lowest band you want to use
and features separate feed points for each band. It also uses
progressivley smalller tubing as the frequency increases. I am going to

build a 146-442 MHz dual band version but may include 53.53 MHz if I can
find a rig to use there.

And Ramsey Electronics used to have a 6 meter FM transceiver kit. I just
checked the site and it's not there anymore but I bet there are a ton of
them out there either unbuilt or collecting dust. Might be worth putting
out a "WTB" on the For Sale/Trade lists and Swap boards.
I also Have have two old GE "Prog-Lines" down cellar. The accessories are
somewhere down there too. Maybe it's time I get off my butt and convert
them! I think the xtals cost me more than the rigs did. Bet they can be
had a Fleas for real short money.

If there is any interest, I will run BeacoNet from FN42qw this weekend over
the night 147.585 mhz. 50 watts output to vert antenna 20 feet off the
ground. Hopefully the antenna will go higher very soon. I've been running
it almost every night for the last week but no reception reports as yet
There has been VHF/UHF enhancement every night for the last week I think
due to the fact that I'm right on the coast, nice inversion. Seeing DX TV
sigs with "rabbit" ears on the little TV upstairs.

Hi All
I built one of these antennas about 3 years ago. I made one nice change I
though you all might like to know about. Instead of stripping the coax shield
back and using hose clamps I mounted an SO239 in a 1/4 " thick plastic (used
for strain relief) any reasonable size will do. I then used 1/4 "diameter
coper tubing I flattened one end and drilled it so I can use a small nut and
bolt to mount it to the SO239 (and solder) I flattened it far enough out so I
can drill a hole in it and fasten it to the plastic. For the center conductor
I bent it and soldered it to the SO239 then flattened, drilled and mounted to
the plastic. Make your leads long enough to reach beyond the to antenna
parts. Bend the 1/4 " tubing (at the antenna) so you can use the hose clamps
for tuning. Ounce you get the SWR right solder the 1/4" tubing and remove the
clamps.

I have a 6M JPole made out of copper tubing. During the winter, something
bad happened to my beam and the swr on 10m went all over the place. Since
the roof was covered with snow and ice, repairs were out of the question.

I decided to try and load up the 6M Jpole on 10M using my MFJ-949 tuner.
To my suprise, it loaded up quite well and I could get a really good SWR
with relatively small adjustment of the tuner.

I have been reasonably successful with 10M BeacoNet - having both seen and
been heard by many BeacoNet stations in both North America and Europe at
one time or another. Most of this has been done using the 6M Jpole, loaded
up on 10M with the atu. It's much better on 10 than my G5RV and comparable,
at least for BeacoNet work, with my beam. (now fixed)

The 6M Jpole also works very well on 6M as it was intended to. No ATU is
needed of course and I used it to make ssb contact with several Scottish
stations one morning in late February, when we had the most amazing 6M
opening between New England (Boston) and Scotland, lasting about an hour.
So I guess it's OK on 6 also. I have only tried BeacoNet on 6m a few times,
so far with no success.

Anyway, if you are short of an antenna for 10M and have a 6M Jpole, try
loading it up on 10 and see what happens! Hopefully you will be as suprised
and pleased as I was!

I have a 220MHz beam, now I wonder if that will load up on 440..hm hm...

Hi Tad

I was wondering why you don't want to leave your PC on? I do and just turn
off the monitor. I have not seen any difference in the power bill.

I think that you would want a Kentronics KPC3 ROM version 8 or better. If I
am wrong I am confident that someone will correct me. The price of the TNC
will buy you a lot of juice.

Rendered body type: text/plain

Hello all,
Running BEACONet on 147.585, 80watts,18db gain beam heading SW 40ft high.
 Computer is a pentiumwith windows 98. The TNC is an old TNC2. I don't
think I have things set up correctly. I have a second receiver on
147.585 into a Baypac TNC using Baycom terminal on a laptop for
monitoring my own signal

When a transmission is made the following is displayed on the main
computer
                "=4132.00N/07036.00W-W1TJW-c.macdougall@juno.com"

However the laptop displays the following
                "R62 18.21 W1TJW>KK16G3-8>UI.FO
                =4132.00N/07036.00W-W1TJW-c.macdougall@juno.com

This is what is going out over the air as received by my monitor system
but is not echo'd on the main computer. I added my call sign to identify
myself. Any one have any suggestions???

Tad:

Leave your PC on! Ever notice that a light bulb always
seems to burn out when switched on? It does this because
the filament gets "shocked" by the rapid temp change it
sees when turned on. PNP (transistors, etc.) junctions,
while more durable, are also suspect to the same stresses.

If you are trying to save power - turn off the monitor.
It's cheaper to replace than your PC and uses far more
energy. Personally, I just leave it on and have a blank
screen saver.....

My two meter beacon/HUB is off the air due to thunderstorms.
Unless it continues to storm, the becaon should be back on
the air by 12:00 UTC (8 AM EDT).

Hi Colin

It looks like you have set up wrong. easiest way to set up would be to go to
Ev's web site and follow the instructions. One suggestion, print out the
pages you need they make a great referance when you have to look back.

It looks to me like you have Longitude and latitude inplace and BEACOnet does
not use them unless you are a rover.

Rendered body type: text/plain

Hi Colin,
Rich's comments were the best to follow...hit the BEACONet website
(http://go.to/BEACONet) and do the following:

1. Configuration | Level I
2. Configuration | Level II

As an aside, your transmission should look like this (on the
transmitter-side):

W1TJW>VK16G3-8:[GR##ID] c.macdougall@juno.com

This should appear at the bottom of your map window (obviously, you'd
use your own real grid <smile>).

What you are sending is:
W1TJW>KK16G3-8>=4132.00N/07036.00W-W1TJW-c.macdougall@juno.com

Your Configuration Code is invalid (there is no band designation that
starts with "K"). If you are on 147.585-MHz, that would be a VHF band,
so the band is "V". There is a Configuration Code calculator (java
based) on the website, under the "Configuration | Configuration Code"
link, just to verify your settings -- if you are interested in doing so,
btw.

In BEACONet, we do our best to keep transmissions as short as possible
-- so we use 6-character grid rather than full lat/lon.

Don't dispair, though! You are very close to being right on the money
with your system. Stick with us...the tropo season is starting to ramp
up in the northeast, and the Perseids meteor shower is only a couple of
months away.

Welcome aboard!
Ev, W2EV

ps...you've got quite a large beam. it may not perform very well this
high in the band. BEACONet was designed to favor vertical polarization
and small antennas (omni's really) for a couple of reasons:

* Vertical dipoles make excellent omnidirectional antennas (you
  never know in what direction the band will open...it would be
  a shame to miss an opening because the antenna was pointed in
  the wrong direction).
* Vertical will provide extra isolation when used at the home of
  a VHF narrowband station...allowing one to plot DX on BEACONet
  and operate SSB/CW concurrently...with little self-interference.

Consider a simple vertical dipole mounted on the southwest part of your
tower (since there probably isn't much to receive in the Atlantic Ocean
<g>) for the reasons above (though, I'm sure it's doing a fine job of
enhancing your signal...you may be cross polarized to a majority of
other users, if you are horizontal).
((whew...the p.s. was almost longer than the body text)) :o)

Hi Tad,
The BEACONet project works *best* if you are using a Kantronics
KPC-model TNC with ROM 8.2 or above. You can find 'em used...just make
sure the ROM is at least 8.2. Any ROM-version that is lower is as good
as option #2: any TNC2-clone that includes KISS mode.

If you run a KPC with ROM8.2 or above, you may shut-down your computer,
leaving your TNC and transceiver operating (a good thing) in
Peer-Hub-mode. If you have a TNC2-clone, then you may do the same
thing, but you are considered operating in Client-Hub-mode (still good).

The terms Hub, Peer and Client are explained on the BEACONet web page
(http://go.to/BEACONet) under the hyperlink: Introduction | The Lingo.

By the way...UI-View (the software on which BEACONet is based) will work
wonderfully on Windows ME.

Hi Tom,
It's great to have you on board. The more participants we have, the
better our chances of snagging an opening (it's the old "if a tree falls
and no one is listening" thing).

We've seen excellent success on 10-meters, started to see a success on
6-meters (both ionospheric phenomena), and the 2-meter tropo season is
starting to build so we expect to see some good successes as the summer
heats up (not to mention some meteor work around the Perseids and
Leonids).

BEACONet is aking to radio-fishing. There can be a lot of waiting, but
it's just a matter of time until you are rewarded with a great catch
(several caught screen shots are posted to the BEACONet web site, by the
way).

Welcome aboard!
Warmly,
Ev, W2EV

Rendered body type: text/plain

Six Meter PropNet'ters,

At 9:20 this morning, (Saturday), I started hearing a STRONG carrier
popping on at 53.530Mhz, short transmissions, at 12 second intervals.
The signal is hitting S9 to 20 over. Unfortunately there is NO
modulation.

If anyone is on Six running Meteor mode, you might want to check your
transmitted signal for modulation.

Thanks,

Joe, K4DMU
Louisville, KY EM78FF

Interesting! I always wondered if the SoundCard worked as well as other
solutions. Of course, there are a lot of variables...but this is
interesting, none the less.

I'm active on 28.128, but the band is absolutly dead from NY. No SSB no
CW beacons, nothing.

Notwithstanding your success on 10-meters...I'm getting really excited
about our 6-meter stuff! This is fantastic!

Keep the reports coming in. Frankly, I may have erred by asking people
to include eMail addresses in their beacon...because it encourages a
direct QSL, rather than doing so through the list serve (and thereby
encouraging others with their success).

Please...post your successes to the list so the lurkers will be
encouraged to join us! :o)

Hey Rich,
       My wife and son were out shopping today and my 6 meter BEACONet
station was running Level I all day today while we were gone. We got
home about 9:00 PM and I checked the heard log on the KPC-3 using
PACTERM in DOS. It showed that I copied WD4RBX on 53.53 MHz at 19:23
today (Saturday 05/12/01)! Your 1 watt made it up to Northwest Arkansas
this evening. I see you also copied me too, cool!

Rendered body type: text/plain

I haven't checked my KPC-3 for several days.
Well, it heard the following stations:

W3LIF   09-MAY-01 @ 12:17 UTC
W8SP-3 09-MAY-01 @ 12:56 UTC

That's my list, but at least I caught some fish.

Howdee EV and group,

I guess I'm trying to make my hardware do what it wasn't intended to do.
But.....

I'm using an IC-706MKII-g with a rigblaster and my pc. It works well with
alI the digital modes.

So far I have not purchased a tnc. I'm using the pc configured to receive
packet radio via AGWPE. I can receive incoming packets fairly well.

Can this combination of "no tnc - soundcard packet" work with UI-View? How
well might it work?

Thanks!

Wayne, n4gil@bellsouth.net

ps. Keep up the good work!! Yes, there are "lurkers" out here..... :)

Cool! W3LIF is in PA (EN91SF) and W8SP-3 is a BBS on 147.585 that is
deeper in W.Va. (EM99WL). Given that you are in EN90 and the topology
of their area is quite hilly/mountain-like, these represent some very
good catches.

Last year, I snagged W8SP several times from NY (FN03XD).

Nice report, Mark!

I have a similar setup -- though am using homebrewed cables, rather

than a 'blaster. No TX at the moment, just RX. Need to do some antenna tuning before I'm ready to put juice into the wire. Antenna is a hacked together vertical dipole for 2m @ not very far off the ground.

The setup seems to work well enough for snooping the local DX cluster, (K4FJ) and for listening in on PSK31 sessions, but I've yet to fish out any BEACONet traffic. Only been at it since yesterday though, and am currently only listening on 2m. I'll give it some time and see what appears. Is there anyone else on the net in the DC metro area who's had any success?

Rendered body type: text/plain

Just (1320UTC) checked my screens and discovered I'd had a couple hits this morning. Between 12:14 and 12:29 UTC I had several plots on WD4RBX and digipeated them back plus had a couple digipeats on my beacon from him. All three monitoring systems (Baycom, MFJ 1276 and soundcard/AGWPE) received his signal though the MFJ received one extra plot on him and one extra digipeat of my beacon that the other two didn't.

At 1241 UTC the MFJ 1276 scored one plot on K9ER (my first hit on him) that the other two missed completely.

Haven't figured out why one device works better than the others at times unless they are partial to certain strength/sounds of signals. Yesterday, all three copied N4ZQ simultaneously. Experimenting is the "name of the game."

Don't forget ..... Happy Mother's Day!!!!!

Bob - KC5DUI - EM26WE

Hi Wayne,

I'm using three different systems on 10M BEACONet - AGWPE with SoundCard and Baycom on one computer plus an MFJ-1276 direct on a second computer. AGWPE and the SoundCard are set up for xmit/rcv while the other two just receive. Haven't figured out why but at times one will receive better than the others, other times all three copy the same (and I haven't changed any settings in quite a while). The AGWPE/SoundCard seems to do an excellent job on xmit as others don't seem to have trouble copying my beacon (I get digipeats back). It's a great way to experiment without spending additional money for a TNC (I'd purchased the Baycom and MFJ a number of years ago when I was interested in 2M Packet).

Hope to see a beacon from you on 10M soon.

Bob - KC5DUI - EM26WE

Hey Bob

Sorry, but no joy in seeing you on the screen here. Thanks for the e-mail
report of my beacon making it to you. I believe that the reason the 2 packet
burst that you copied were so close together is that I was in the shack at
the time. I thought I might have heard a packet burst come through the
speaker. A quick check of the map didn't show anyone copied. So I reached
over to try a little fishing and F9 the program a few times, in hopes of
hooking someone. Well, guess I got ya. But this leaves me wondering if maybe
our 10 meter beacon rate might be a bit short. If I wasn't around the rig at
the time, I would have missed this short opening. Maybe an increase in the
beacon rate would produce more reports. At least till we get more station on
28.128. Also I sometimes hear weak packets, but they sure don't sound like
they tuned to the same frequency I am. 1200 BPS, SSB packet tuning is very
touchy. Maybe a few stations around that could act like a frequency standard
that others could tune to would help. A faster beacon rate of other then
once every 5 minutes might help here also. What you think? Keith N4Zq

Good morning Keith,

Since 10M propagation seems to be rather sporadic at the moment and there
don't appear to be a "lot" of beacons out there to grab, sending a burst
more often looks like a good idea to me. UI-View lets us pick a time down
to the decimal (I've been using 5.25 minutes so if someone happens to hit
the same time I'm on and is using five minutes we'll be apart the next
transmission) which leave us lots of room to keep signals separated. I
think I'll try 2.1 minutes for a while and see if that improves my chances
of someone hearing/seeing me.

I also hear bursts out there that don't break - don't know how exact my rig
is and it probably drifts a bit as things warm up. I'm running my TS450
with the 8.83 filter at 6K and the 455 filter at 2.4K - seems to give me the
best response at this time.

Will try to leave things running 24/7 unless a storm is forecast or 20M
BEACONet^31 snags me!

Bob - KC5DUI - EM26WE

As of 1845 UTC am still receiving sporadic plots from W2EV. Haven't seen anything on WD4RBX since early
 morning so things are moving one-way at the moment but did have a couple shots on KD7AN-3 (first time
I've noticed this one - no email address showing) around 1657 UTC. Today is the BEST I've seen in a
LOOOONG time.

Bob - KC5DUI - EM26WE
    UTC I had several plots on WD4RBX and digipeated them back plus had a couple
    digipeats on my beacon from him.

  Thanks for the report Bob. I was wondering if my setup was working right. I
  am still receiving you 17:28 UTC. Also getting the W2EV digi from you.

  Rich

Wow...what a day!

On 10-meters (28.128), I show a catch of: KC5DUI and K4DMU (hi Joe!)
having been received in Western New York.

I just got word from N0ALJ that 6-meters (53.53 MHz) is hopping, too!
Two catches in the form of WD4RBX and W8DQ being heard in Arkansas!
This screen shot is being posted to the BEACONet website. Check it out
at http://go.to/BEACONet | Participation | BEACONet Successes. It'll be
there in 10-minutes.

The fish are biting today!

Rendered body type: text/plain

Ev and company. Beginning to wonder if I live in a 53.53 black hole.
Have yet to hear or be heard. Know set and antenna are functioning OK
as have made a number of local contacts on 6m simplex and even heard
some W9's on 52.525 this morning on vertical. SWR on 53.53 is tad high
without tuner but OK (~1.5:1). Transmitter is 50 watts and can add amp
and get close to 100. SSB setup is going great guns on openings
(several in past few days including today). TNC seems OK as I can log
into local digi and hit the ISS a few days ago. Increased TXdelay when
on amp to give relays time to pull down. Also sounds "good" if
monitored mobile (was able to hear beacon fine - by ear - about 28-30
away today. Maybe it comes down to as one 6m antenna sage told me -
"Location, Location and finally, Location.

If anyone does happen to intercept me, please drop a line. If anyone is
near the EM42/EM52 line, give a yell so I can check this out on LOS. I
set beacon time to 10 mintues when I am around and 15 for workdays.
Running 24/7 except during "boomers".

TNKS - Bruce, KD5IUG [EM42XI] - Still fishing but no bites!

Hi all
Me again. You all can add W1JHJ (11 stations) to my report.

I wish I had remembered to start a log file. I got home from work today just after 1 PM. and KC5DUI was coming in. A while later KC5DUI dropped out and nothing for a while. Next N1NCO started coming in about every minuet. He dropped out then W1JHJ started coming in and now both N1NCO and W1JHJ are coming in. Ev is your antenna hooked up or maybe the propagation Gods haven't smiled on you yet? LOL.

Hi Bruce

Hang in there. All that is needed is for the propagation Gods to smile on you. You might want to increase your TX time to 5 minuets. It sounds like you have a killer set up power wise. I am running 14 watts into a J-pole and have enjoyed success.

> Ev and company. Beginning to wonder if I live in a 53.53 black hole.
> Have yet to hear or be heard.

Hi Bruce,
You and me, too. I've been on 53.530 for a full year now. No plots,
nada, nothing. Yet, others recently have seen some very interesting
success. Why? More than likely it's a matter of geometry and
participant-density (# per square mile...nothing to do with intellegence
<grin>).

There is a school of thought that says -- in an ionospheric path --
openings tend to favor geographically narrower areas, as the operating
frequency increases. As a result, there is a need for greater number of
active stations to make up for the narrower geography of the openings.
BEACONet is uniquely suited to support or modify this school of thought.

Stick with us, Bruce! :o) We learn as much by our misses as we do our
hits.

><HTML><FONT FACE=arial,helvetica><FONT SIZE=2>You not kidding, 24 hour
report. If anyone is interested I attached a screen

I don't want to seem like a wet blanket, but can I ask that large binaries
are either mailed direct to people who say they want it (say after sending a
simple message asking for people to request it, on the list first) or made
available at a web site?

Some of us use Text only systems to get the digest. So, even if the picture
was of interest, it wouldn't get through here. I also delete any attachment
or binary that I didn't expect to get. This simple policy stops problems
such as the Homepage virus from getting through to my HDD. HI!

Binaries also make the digest almost unusable, as a bitmaps, like the ones
that have been sent recently, get split into many pieces.

Alternatively if the PropNET group is to become a binary file exchange
group, I'll just quietly unsubscribe. Possibly, I wont be the only one....

Thanks de Dave (G0DJA)

Rendered body type: text/plain

Thought this might be of interest to you timekeepers out there. Especially
those of you using WWVB at 60khz

WWVB normally broadcasts 50 kW of radiated power from two separate antenna
arrays. These antenna arrays are suspended from
122-m high towers. On February
27, 2001 a guy wire that supported one of the
towers failed, causing one antenna
array to be unusable. As a result, WWVB is now
broadcasting from one array only,
and the radiated power is 37 kW. The damaged
antenna array is currently being
repaired, and the work is scheduled to be completed
sometime in June 2001. When
repairs are completed, WWVB will return to normal
operation, and will again
radiate 50 kW.

Most WWVB clocks and receivers will still work
fine, even with the reduced power.
However, if your clock or receiver isn't working as
well as it used to, we suggest:

Make sure that the batteries are good.
If you have a desk top unit, try rotating it 90
degrees. If you have a wall clock try
mounting it on a wall perpendicular to the one it
is currently on (e.g. if it is on a
north-south wall try a east-west wall). The
antennas are directional and you might be
able to improve the signal strength by turning the
antenna.
Place the clock along a wall or near a window that
faces Colorado.
Locate the clock at least 1 or 2 meters away from
any computer monitors, which can
cause interference (some monitors have a scan
frequency at or near the WWVB
carrier frequency of 60 kHz).

NIST radio station WWVB is located on the same site
as WWV near Ft. Collins, Colorado.

The WWVB broadcasts are used by millions of people throughout North America to synchronize consumer electronic products like wall clocks, clock radios, and wristwatches. In addition, WWVB is used for high level applications such as network time synchronization and frequency calibrations.

Signal Description

WWVB continuously broadcasts time and frequency signals at 60 kHz. The carrier frequency provides a stable frequency reference traceable to the national standard. There are no voice announcements on the station, but a time code is synchronized with the 60 kHz carrier and is broadcast continuously at a rate of 1 bit per second using pulse width modulation. The carrier power is reduced and restored to produce the time code bits. The carrier power is reduced 10 dB at the start of each second, so that the leading edge of every negative going pulse is on time. Full power is restored 0.2 s later for a binary "0", 0.5 s later for a binary "1", or 0.8 s later to convey a position marker. The binary coded decimal (BCD) format is used so that binary digits are combined to represent decimal numbers.

The time code contains the year, day of year, hour, minute, second, and flags that indicate the status of Daylight Saving Time, leap years, and leap seconds. For more details, view a graphical representation of the WWVB time code.

WWVB identifies itself by advancing its carrier phase 45° at 10 minutes after the hour and returning to normal phase at 15 minutes after the hour. If you plot WWVB phase, this results in a phase step of approximately 2.08 microseconds.

Antenna and Transmitters

WWVB uses two identical antennas that were originally constructed in 1962, and refurbished in 1999. The north antenna was originally built for the WWVL 20 kHz broadcast (discontinued in 1972), and the south antenna was built for the WWVB 60 kHz broadcast. The antennas are spaced 857 m apart. Each antenna is a top loaded dipole consisting of four 122-m towers arranged in a diamond shape. A system of cables, often called a capacitance hat or top hat, is suspended between the four towers. This top hat is electrically isolated from the towers, and is electrically connected to a downlead suspended from the center of the top hat. The downlead serves as the radiating element.

Ideally, an efficient antenna system requires a radiating element that is at least one-quarter wavelength long. At 60 kHz, this becomes difficult. The wavelength is 5000 m, so a one-quarter wavelength antenna would be 1250 m tall, or about 10 times the height of the WWVB antenna towers. As a compromise, some of the missing length was added horizontally to the top hats of this vertical dipole, and the downlead of each antenna is terminated at its own helix house under the top hats. Each helix house contains a large inductor to cancel the capacitance of the short antenna and a variometer (variable inductor) to tune the antenna system. Energy is fed from the transmitters to the helix houses using underground cables housed in two concrete trenches. Each trench is about 435 m long.

A computer is used to automatically tune the antennas during icy and/or windy conditions. This automatic tuning provides a dynamic match

between the transmitter and the antenna
system. The computer looks for a phase difference between voltage and current at the
transmitter. If one is detected, an error signal is sent to a 3-phase motor in the helix house
that rotates the rotor inside the variometer. This retunes the antenna and restores the match
between the antenna and transmitter.

There are three transmitters at the WWVB site. Each transmitter consists of two identical
power amplifiers which are combined to produce the greatly amplified signal sent to the
antenna. One transmitter delivering an amplified time code signal into the north antenna
system, and one transmitter feeds the south antenna system. The time code is fed to a
console where it passes through a control system and then is delivered to the transmitters.

Using two transmitters and two antennas allows the station to be more efficient. As
mentioned earlier, the WWVB antennas are physically much smaller than one quarter
wavelength. As the length of a vertical radiator becomes shorter compared to wavelength,
the efficiency of the antenna goes down. In other words, it requires more and transmitter
power to increase the effective radiated power. The north antenna system at WWVB has an
efficiency of about 50.6%, and the south antenna has an efficiency of about 57.5%.
However, the combined efficiency of the two antennas is about 65%. As a result, each
transmitter only has to produce a forward power of about 38 kW for WWVB to produce its
effective radiated power of 50 kW.

Performance

The frequency uncertainty of the WWVB signal as transmitted is less than 1 part in 1012. If
the path delay is removed, WWVB can provide UTC with an uncertainty of less than 100
microseconds. The variations in path delay are minor compared to those of WWV and
WWVH. When proper receiving and averaging techniques are used, the uncertainty of the
received signal should be nearly as small as the uncertainty of the transmitted signal.

Hi Ev and Rich,

Had W2EV on the map around 1400-1440 UTC (plus randomly before that).

Currently am showing WD4RBX and was able to do a QUERY and find out his Station Info:
    Rig is HTX100 25 watts into a Antron99 @ 40 Feet.
    Computer is a home built 200MHz. UI-View32 V1.04 (V1.40??)
    TNC is a MFJ TNC-2
    .....think I missed the line here ....
    Location is 35 miles SW of Greenville, SC.

Also sent him a message and received an ack.

73,

Bob - KC5DUI - EM26WE

Was punching out beacons on 28,128 all afternoon today and I did not see
anything in return. About 0100Z I tuned down the band and heard some
activity from the East Coast in the phone portion of the band.

Did anyone happen to see my packet? I appear to be transmitting, but not
sure if I am receiving. Had a few problems with the sound card and I may
not have it setup correctly.

Thanks

Jeff N7YG DM42NF

Sorry to say, no propagation from you (to me in FN03) yet, Jeff. Please
don't give up, thoug. As far north as I am, I often don't get the same
propagation as those further south (and copied Argentina only twice).

If you have a way of tuning to the APRS frequency of 144.39 MHz to test
your system on RX, you may want to...BEACONet will decode APRS stuff and
this is a good test, if you can muster it.

This is encouraging information! I'm working on building a similar
setup (but with SoundCard rather than TNC) and wondered if 25 watts is
enough to have moderate success. With as often as Rich is successfully
received, I guess the answer is "yes"! :o)

Hi Ev

Yes, 25 watts works a bit better then moderate. I am running late tonight My
daughter graduated from collage tonight. I will be reporting tomorrow. I will
send you the screen shot from the weekend and today's log file with 8
stations.

Ed
Did as you suggested and I copy the ARPS stuff from 2 meters OK. I also
believe I had some problems with some of the files for UI-VIEW. I
reinstalled everything then updated to V1.55. So I will run the station
over night to see what happens. Last time I did this I logged a bunch of
stuff just as the sun was starting to come up.

Not sure how the files got corrupted, but I have been having a problem with
random files getting corrupted in Windows. I believe it has something to do
with my Linux installation on the other drive, but am not sure.

Hi Ev, Thanks for suggestion but I think I solved that problem. After
some experimenting I discovered that when I included the Email address
inside the square brackets with the grid it transmitted along with
everything else. The instructions don't seem to spell out the need to do
that. I am beaconing every one minute on 147.585 but don't think I am
interfering at all at least for now.

Hi Colin,
The solution that you used isn't necessary. Your frame format should
be: CALL>bsnmap-#:[GR##ID] email@host.com

I'm stumped as to why this didn't work. I wouldn't mind helping a bit
more. Take a sample of your tx frame (copying it from a Terminal
window) and send it along to the list. Something may pop up that didn't
before.
Ev

230. [propnet] New Station in Co. Cal on 147.585!

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Wed, 16 May 2001 07:11:27 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>

Hi all,
I got a message from a new BEACONet-er. I've forwarded a snippett of
his eMail for you below. If you're in the area, give a listen. I'm not
sure if he's subscribed to the listserv yet, so if you're active in this
area, drop him a direct note, too -- would you?

It's important for new folks to hear from us because there isn't always
the propagation to support the DX we're searching for and until they
realize that BEACONet is more like fishing than hunting they can get
unnecessarily discouraged (as if there is a good reason to get
discouraged <g>). Anyway...yet another propagation enthusiast has
joined the ranks!

Ev, W2EV
- -
I enjoyed your article in QST and configured an old computer and TNC
on the 2 meter frequency to see what I could find. So far I've been
operational (I think) for several days in the Burbank, (Southern
California area.) I haven't seen any other stations yet. I'm surprised
that I haven't had any hits, since this is a very active ham area.

Don't forget that there is a school of thought that infers that
polarization rotation can take place on an HF circuit, due to
interaction with the ionosphere. So polarization isn't such an issue on
10-meters as it is on 2-meters. fwiw.

Hi Jeff

Sorry nothing heard. I am going to try to help you out. The next time the
band opens and I am home to see this I will run 100 watts and my 6 ele beam
pointed at you. I will be off for the next 3 days.

This is significant...and a major plea to establish a system of
Hub-class stations all across the continent on BEACONet. I'll comment
more on this later...gotta go to work now.

Ev, W2EV

ps: WA5IHL is an APRS "Wide Digipeater" at extreme height...Earl heard
this...not direct, but through it. Think about this as we ponder the
importance of Hubs. :o))

Just downloaded UI_VIEW and AGWPE ... the only tnc I have is a
Baycom so I want to use my sound card that is setup for PSK etc. when I try
to initialize AGWPE I get a error message "Cant find reqired dll
w32_32.dll" when I try to use UI_VIEW I get a message that AGPWPE not open
"Failed to a DDE connection to AGWPEin IDEAGW.VBX".

 I Presumed that in downloading SV2AGW Packet Engine that all the files
would come with it. At the present time all I want to do is monitor Ten
Meters.

 What am I doing wrong . Help

237. [propnet] 6 m PSK31

From: Michael E Dobson <dobfam4@juno.com>
Date: Wed, 16 May 2001 17:04:28 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-13141-2001.05.16-16.24.22--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

An item on the BEACONet Web site described how UI-View can now work with
PSK31 via the PSK31srv software and asked for discussion about a 6 meter
frequency. It suggested the current freq of 53.53. One concern would be
interference between the FM AFSK packet users and the USB PSK31 users.
Can these two modes coexist on the same frequency? The standard USB 6
meter frequency is 50.290. Perhaps BEACONet could use 50.295 USB so that
it is adjacent to other PSK31 activity. Alternatively PSK31 can be done
via FM. If that were used then it should be possible for packet and
PSK31 to coexist on 53.53.

Mike, WA3KYY

At 07:43 AM 5/16/01 -0400, Ev Tupis blasted the following out into the ether:
>This is significant...and a major plea to establish a system of
>Hub-class stations all across the continent on BEACONet. I'll comment
>more on this later...gotta go to work now.
>
>Ev, W2EV

      Unfortunately, this afternoon, this station is shown in ALBUQUERQUE,
barely 200 miles away! Something must have been on the fritz in his GPS...

      I sent:

>>KC0CRO>GPSMV,WA5IHL-11*,WIDE3:$GPRMC,035218,V,4348.4351,N,07009.8096,W,0.0
>>00,0.0,160501,17.2,W*5A
>>KC0CRO>GPSMV,WA5IHL-11*,WIDE3:$GPRMC,035218,V,4348.4351,N,07009.8096,W,0.0
>>00,0.0,160501,17.2,W*5A
>>KC0CRO>GPSMV,WA5IHL-11*,WIDE3:$GPRMC,040218,V,4348.4351,N,07009.8096,W,0.0
>>00,0.0,160501,17.2,W*58
>>KC0CRO>GPSMV,WA5IHL-11*,WIDE3:$GPRMC,040218,V,4348.4351,N,07009.8096,W,0.0
>>00,0.0,160501,17.2,W*58

      And, all three packets are the same! That should have tipped me off,
but I confess that I was still asleep when I sent the message! <G>

>ps: WA5IHL is an APRS "Wide Digipeater" at extreme height...Earl heard
>this...not direct, but through it. Think about this as we ponder the
>importance of Hubs. :o))

      WA5IHL-11 has been a great digi in the past, often being in an area
of propagation when my station is not. However, in this case, it just did
what it should have.

Hi Rich,

At least you had "something" - in NW Arkansas 10M has been "sucked" dry. Am going to shut down tomorrow
 morning as we'll be out of town (taking our daughter to a college interview) and they are "forecasting"
 thunderstorms for tomorrow evening and Friday. With my luck, the thunderstorms will go through the
whole weekend as well. Will let you know when I'm back up and see if I can get all your station info.

Bob - KC5DUI - EM26WE

  The band conditions here in South Carolina really sucked today.

Mike's comments make sense. Of course, the issue of frequency choice
can be a complicated one. Much relies on the purpose of the service,
too. 53.530 FM, vertical polarization was chosen for BEACONet because
it is known to be vacant in the western hemisphere (really!), and that
it represents a large frequency seperation from the SSB/CW subband --
allowing SSB/CW 6-meter operators to establish a 6-meter BEACONet
station without inflicting much self-interference.

BEACONet^31 on the other hand, may need a different frequency for a
number of reasons (or maybe not). I'd be interested to see how this
thread grows.

Ev, W2EV

One concern would be

Hi Dan,
Welcome to BEACONet! With any luck, you'll get a response from someone
who's tried to use AGWPE. I haven't, but I can say that it works.

The first error you get is as a result of an improper installation of
"something". I did a search for the file on my Windows 2000 based
laptop (without AGWPE loaded, by the way) and it is not there, so I have
to assume that it is part of the AGWPE load.

I'd try uninstalling AGWPE, downloading it fresh (there's a link to it
on the BEACONet website: http://go.to/BEACONet) and reinstalling.

I use AGW all the time, but I've never received the W32_32.dll message.

>the first error you get is as a result of an improper installation of
>"something". i did a search for the file on my windows 2000 based
>laptop (without agwpe loaded, by the way) and it is not there, so i have
>to assume that it is part of the agwpe load.

Funny thing -- I'm running it RIGHT NOW and that file isn't on MY
system, either!

>i'd try uninstalling agwpe, downloading it fresh (there's a link to it
>on the beaconet website: http://go.to/beaconet) and reinstalling.

Couldn't hurt, but I seem to recall something about this from
sometime back. Let me do some research and see if I can find the details.

Hi Dan

As I missed your original message, due to a problem with my email server, I
am send this to the list. I use the AGW packet engine. I searched for the
file w32_32.dll and it is not on my machine either. What version of the
packet Engine are you running and what version of UI-View? With the latest
version, there is no provision for using DDE so you must using TCP/IP via
your local host at 127.0.0.1 This is really the best way to run the two
programs. and if you have more that one computer at home, you can log into
the packet engine from anywhere on your network.

Ben noted some exceptional DX from the APRS network on 144.39 MHz:

> Here's one for you from 144.39 looks like 5 RF hops to DM95 from
> N4PK-10>APRS,KB5WIO-7*,WIDE5:!2756.00NN08243.19W#PHG5460 Pinellas
> W-R-FL Clearwater, FL n4pk@arrl.net. Total distance about 1240
> miles! Some day I'll be up on beaconnet after I get some antennas
> up.

For those that aren't familiar with APRS' WIDEn-N digipeating command,
it is alot like our HOPn-N except that path tracing is not available.
The only thing that we learn from the above frame is that it took 5
digipeats to get to Ben (that's the "5" after the word "WIDE") and he
heard it from KB5WIO-7 (that's the "*" after the callsign) and that it
traversed 1240 miles. What we don't know is the path that it took (it
may have taken some interesting bounces along the way, but the APRS
WIDEn-N system will never tell you that).

There is a lesson to learn, though: we need some Hub-class stations.
These are stations that operate at altitude, with higher power and 24/7
operation. At 2-meters, it is these stations that will propagate during
the earlier parts of band openings. This is illustrated by Ben's note,
as "KB5WIO-7" is APRS' equivalent of a Hub (they call them WIDEn-N
Digipeaters), and each of the other digipeats along the way was from
other similar Hub-like stations.

As the summer progresses, those of us running from our houses (not
always on the highest portion of the land) will see more and more
openings directly to/from our stations (tropo *will* build, after all).
However, if we could spend the time to establish hubs on building tops,
hilltops, mountain tops, our 2-meter effort would be much sensitive to
band openings induced by tropo.

Please, give it (establishing a hub or two) some thought, would you?

Uh -- sorry guys. This went to the wrong list.

It was meant to be sent to a railfan list. UP 8101 is a Union
Pacific locomotive, and a HUGE one at that.

      UP 8101 is one of those new 6000/9000 HP convertibles, with a CC
wheel arrangement. I think they're called SD90/60MAC or
something. HUGE! Longer than the SD-70MACs, radiators at an angle, like
the old SD-45's, etc...

Subject: RE: [propnet] More unbelief

Hi Ben:

I think thats the furthest my digi has been seen on VHF. We've had some
very weird propogation causing even havoc on the TV. Two nights ago our
local channel 10 was being blown away by a distant ch 10.

My digi is up only 125' ASL (its on a 10 story apartment building on Tampa
Bay) in Clearwater.

I am sure it either went through KU4LY-7 in Navarre or the New Orleans digi
on the way there probably. We have frequent times the panhandle digis and
my digi talk.

I send out WIDE5-5 once an hour only too.   WIDE,WIDE goes out every 20 mins
I think.

Hi All

Last 24 hours produced these catches.

2 meters = zip

6 meters = N0ALT @ 19:38 also I switched to my whifes call on 6 KF4VAB.

10 Meters = N8QLT and LU3AVO.

Hi Rick, Thanks for your report of seeing my station on Beaconet. I
left home thursday to go to Gardner N.Y. to visit my daughter and family.
 Expect to be home tuesday. It would be fun to see if we can make a
contact using our hoizontal beams. I'll contact you when I get home.

However, we should keep in mind that BEACNet uses vertical antennas and
this should only be a test Not a regular thing. I have an 11 element 2m
beam I plan to put up vertical for BEACONet, APRS, And FM operations.
The 18db hoizontal beam is two stacked yagis I made up. In addition to
rotating them I can also elevate them for satelite work.

I also want to see what can be done with an omni directional vertical
with more than 6db gain as I have now for BEACONet

73, Colin W1TJW [FN41QM]

Hello all,

I just setup my packet station and am starting in Beaconet. My QTH is the
West Coast, just south of South of San Francisco. My antenna is a 5-el log
periodic at 30' pointed north-east, with ~6-7 dbd gain. I'm currently
transmitting 5 watts. I'm normally active (rather than just listening)
after 8p. Let me know if you hear me out there.

Thanks and apologies if this is considered spam,
-Robert

Hi Robert,
Welcome aboard! 5-watts isn't much, but it's better than nothing! :o)

A couple of things to consider...
... BEACONet is alot like fishing: you can go a long time with nothing,
only to catch "the big one" when you least expect it. Patience is the
name of the game, especially at VHF frequencies. 10-meters is open more
often.

... You may find more activity south of you, in the southern part of the
state. Given that you are near the coast, you may experience good
activity if you were to aim in that direction...but that's only a guess
on my part.

... there's nothing wrong with leaving your station active 24/7, not
just after 8pm. You never know when the band could open.

... announcing your activity is nothing like SPAM. It is actually
encouraged. Please...announce any and every success you have. Until we
have some automated way to collect such data, it is important that we
keep eachother appraised of our activity through this listserve.

Again, welcome aboard!

Warmly,
Ev Tupis, W2EV

I wish I were also hearing stations in addition to being heard. It's nice to be heard with just 20w and a Hamstick mobile antenna, but I haven't received a station on 10m since mid-March. I better get a more capable antenna on 10m, I guess.

Thanks for sending the reports, it's encouraging.

Hey folks,

I haven't heard much chatter here lately about BeacoNet via ISS, but it's been rather active lately. Heard mostly voice communication near the end of the week, but looks like the TNC is back on. I'm beaconing with Grid Square and UI-View tags (in case someone wants to try querying my station through ISS) every 2 minutes. Using a J-Pole at about 20' with 25 watts.

My activity log for the past two days (times are EDT).

2001-May-19 12:23 14 stations

Hi Rich

I am wondering about your RXing nothing. If I am not mistaken the Ham Stick is the same kind of antenna I use for camping. I also experimented with it on BEACOnet. What I did was get the bracket (and another antenna) that allows you to turn it into a ridged dipole. I bought 30 feet of top rail chain link fence pipe for about $7.00 a stick. For camping I just duct tape the antenna to the pipe and tie it to the side rail of my truck and in about 10 minuets I am on the air. The antenna works great. I have made a tun of QRP contacts with it and it performed quite well into Europe last winter. You can easily turn your Hamstick into a ground plain stick it up at 30 feet and see what happens. I used the 2 meter ham stick in the ground plain mode feed with 75 Ohm hard line and the wife worked the fire out of the Mir space station.

I was wondering if you also checked to see that your set up is working

properly (RX) by plugging in to the 2 Meter APRS FREQ? Another thing I found
that really improved my reception of packets is to run open squelch. One last
though, Are you sure that your transmit and receive are aligned. I am running
a Ranger RCI2950 on 10 and it has a CLR adjustment that can move my receive a
considerable distance from my transmit freq. I run it at 12 o'clock.

I hope that this helps.

271. [propnet] AGW Packet Engine

From: "Jeff Steinkamp" <n7yg@arrl.net>
Date: Sat, 19 May 2001 17:41:17 -0700
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-13561-2001.05.19-19.59.49--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

All of a sudden I seem to be having a problem with UI-View Version 1.55 and
the AGW packet Engine Version 2000.78. Right after I bring up UI-View I get
a TCP/IP error generated from AGW and a general protection fault window. I
can clear the window then I get a message that says AGW will try to
reconnect in 2 minutes. During that 2 minutes the AGW ICON in the system
tray goes away, but the packet modem light remain. I can restart AGW and
this time is appears to work correctly as it communicates to UI-View and
packets are sent out. I get another instance of the modem lights. Anyone
else have this problem and know of a solution?

Jeff N7YG
DM42NF

PS I am pumping out beacons on 28.128 for this evening, at least until the
T-storms move in.

Rendered body type: text/plain

Hi to All,
I am in Cupertino, California, on 6 meters, with about 50 watts into a
vertical j-pole at 25 feet. Beacons are sent out at 5 min intervals.
Usually I co-ordinate the beacon timing to WWV and the), 0:00, 5:00,
10:00, minuets etc. after the hour. Sometimes this gets "off" a little

bit because of the clock drift. I've been running this way for about two
months with no hits except from my own mobile rig to verify all is
working well.
I am able to leave this station running almost 24/7 except when I
convert over to ISS attempts (not on 6) on 2 meters.

RE: APRS not being able to show the whole path a signal traveled to your
station, if you are using WInAPRS, there is a command in the "lists"
drop down box called "PROTO-PATH". This will list out the whole path of
travel!! Is this available in the DOS version? (I have it but don't use
it).

I will listen for the signal from the "new guy" KG6CFZ for the next few
evenings and report!

My e-mail is ke6aje@arrl.net

Good Luck to all,
Wayne, KE6AJE

Rendered body type: text/plain

I got tired of not hearing stations on 10m with that Hamstick, so yesterday
I restrung my 40m inverted-V dipole (which was laying in the backyard since
our last windstorm) and tuned it up on 28.128. Within 10 minutes I received
the following reports:

2001-May-20 11:16 6 stations

Callsign	Type	Latitude	Longitude	Miles	Bearing	Last Heard
+N8QLT	Grid Squ.	[EN82HL]		0.0	0	May 20 11:15
+LU5DA-3*	Home (HF)	34.30.89S	058.29.43W	5520.5	159	May 19 17:31
+LU7DAC*	Home	34.33.74S	058.31.92W	5522.8	159	May 19 17:30

Times are EDT, both stations were heard via LU3AVO-10.

  What version of the
>packet Engine are you running and what version of UI-View?

HiJeff: Well I am running the version that is downloaded now I think 2.32
for uiview I dont know the version on the packet engine whatever is on the
web in the last week.

 With the latest
>version, there is no provision for using DDE so you must using TCP/IP via
>your local host at 127.0.0.1 This is really the best way to run the two
>programs. and if you have more that one computer at home, you can log into
>the packet engine from anywhere on your network.

Well I dont understand all that......I am trying to use a Baycom 1 in the
KISS mode ...I suspect that I probably dont have that set up right
either..... with the 10m band condx here I dont hear much but yesterday I
did hear what sounded like packet on 28.128 for a while but I couldnt copy
it. I see on the packet engine web site a lot of people are having the same
problem....but I dont see any answers

Like many folks on BeacoNet I'm running the Radio Shack HX-10. My Mic Gain
control is set at 9 o'clock, and PEP looks to be somewhere between 15 and
18watts.

At first I was thinking that this radio, while affordable and very simple,
was going to be a big trade off between hearing and being heard. I thought
20 watts just wouldn't be enough to play on BeacoNet. How wrong I was.

In fact, I think it's more fun having 20watts than 100watts, because it is
an indication of the quality of the band opening- don't need 100 watts when
the band is open.

And it's fascinating to me how often we HX-10 users are being heard with our
20watts, and the distances we're covering.

Playing on BeacoNet has also given me more of a feel for the 10m band, too.
I used to just have the radio on in the truck and wait to see if someone was
talking. It's interetsing to see the data from 10m reports on BeacoNet,
becasue I'm seeing lots of very short openings, between 5 minutes and an
hour in length. This is cool stuff.

Rich

Thanks Ev for the welcome, I'm very excited to see what I do catch.
Currently I can only do 2m due to space restrictions (I have to fit
all my antennas on a 3rd floor balcony). My 6m, unfortunately, is a
horizontal magnetic loop tuned for 50.100, so I'll have to re-tune and
mount vertically before I can get on 6m. I'm going to try to swing my
2m lp SE, and try to snag a contact with KE6AJE sometime today...

Good huntin' everybody!
-Robert, KG6CFZ

Rendered body type: text/plain

I have figure out the problem. I am using the Packet engine with a sound
card. Here is the problem. AGW was in fact crashing. This was caused by
the inability for UI-View to connect to AGW via the TCPIP connection via my
local host. After snooping around a bit I discovered the problem was with
how I allow connections to AGW via TCPIP. I originally had 'Accept without
Login only from MyComputer' checked on the WinSock Interface Security tab.
I selected the No Security option and everything started working again. I
reselected the MyComputer option again. Got the connection error and AGW
crashes. I setup a user and this gets me around the problem.

Further T/S revealed I lost the entry in my Firewall table that allows AGW
Packet Engine to access the internet and act as a server. I also discovered
that when AGW crashes it leaves a security hole in Windows. After the
crash, if you restart AGW it appears to allow anyone from any TCP/IP
connection to connect. (this is not a good thing especially as it bypasses
the firewall somehow).

Hi, Robert,

I am making a "computer file" of California
2-meter BEACONet stations and will add
your station to the list.   When the list gets
a little longer, I will forward it to everyone
who is so recognized.

By the way, I have about the same situation
as you do. Fourth floor apartment, 5/8
whip on the ledge outside. 50 watts.

However, I am being heard up to 90
miles away.

Rendered body type: text/plain

Do you want to add functionality to your UI-View experience? Do the
following and you will be able to be a digipeater for others to use,
should the band open. Why would you want to do that? Check out
http://go.to/BEACONet | Participation | Successes | 10-m Very Cool!

This applies to all BEACONet-ers, not just those on 10-meters. Please
take the time to do this.

Ev, W2EV
Thanks to the eagle eyes of several BEACONet-ers who brought this stuff
to my attention. Sorry for the delay in getting it back out again.
Yes...there's even more after this, but let's do this first. I'm
thinking of writing an ARRL Web Extra article as a followup to clarify a
few things.

- -

Exit from UI-View and edit your UI-VIEW.INI file so that it shows the
following entries:

[DIGI_OPTIONS]
UIFLOOD=
UITRACE=HOP

Notice: this is different than what was printed in QST. There is no
hyphen in UIFLOOD or in UITRACE

Now, start UI-View and set the following parameters:
Setup | Station Setup
 Unproto Address = bsnpah-#,HOP1-1   (where bsnpah-# is your
                                       configuration code)
 Add UI-View Tag = X

Setup | Digipeater Setup
 Enable digi = X
 UI Only = X
 HOPn-n = X
 Alias = your callsign
 Sub Alias = your callsign
 Dupe secs = 60

Setup | APRS Compatibility
 No UI-View Extensions = unchecked

282. [propnet] BEACONet in the June VHF Contest!

From: "E. Tupis W2EV" <w2ev@rochester.rr.com>
Date: Sun, 20 May 2001 19:36:03 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-13694-2001.05.20-19.54.28--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I thought that I'd let the BEACONet community know that I've been
contacted by several VHF rovers with an interest in BEACONet as an
all-amateur way of being tracked during the contest. They want to be
sure that every station who wants to make contact with them is given the
opporunity to do so.

One Rover will have both 2-meter and 6-meter BEACONet operational.
Stations in their area are gearing up to track them and keep logfiles.
This will be a great test to see which of the two bands is better for
such simplex (non-digipeated) BEACONet operation.

Why use BEACONet instead of APRS? Easy...6-meter SSB operation (as
would be the case from a VHF contesting rover) takes place around
50.2-MHz. BEACONet is at 53.530-MHz...a looooooong way away; therefore
minimizing the chance of self-qrm. Ditto 2-meters, where SSB activity
is around 144.2, whereas BEACONet is at 147.585 MHz (compared to APRS at
144.390).

Yet another "BEACONet Advantage". :o)

Stay tuned...more info will follow as it is made available.

Ev, W2EV
More information on the use of BEACONet for VHF Contesint Stations is
available at http://go.to/BEACONet | Information | Contes and RadioSport
Use

Rendered body type: text/plain

I hate to sound like a broken record, but the long term future of the 2-
and 6-meter BEACONet service is predicated on the establishment of
Peer-Hub's (Kantronics TNC w/ROM 8.2+, at elevation, running 24/7/365).

Please, if you have it within your means to establish one, please do.
Tropo openings will most likely be observed by these types of stations
much earlier than at home stations. This is not the case with 10-meter
operation, which is ionospheric in nature, and height isn't as much of a
factor.

Visit the website and look over the information on Hubs, please.
Everyone in the area where you establish it will be appreciative (and
establishing one in every 4-character grid would create quite a
propagation tracking blanket). :o)

Hi Robert,
Before you go retuning your loop, give some serious thought to using a
simple vertical dipole. Believe it or not, I've setup with a simple
SO-235 as the center of a dipole, with the dipole suspended using a
clothes pin! It's cheap and quite effective.

287. [propnet] Personal Maps for UI-View

From: esack <esack@pacbell.net>
Date: Mon, 21 May 2001 03:09:33 -0700
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-13753-2001.05.21-05.26.26--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

For the general benefit:

Very quickly I found that I wanted to add my own favorite
maps to the UI-View Maps files.   The instructions in
UI-View "Help" get you there fairly easily.

I use both Delorme "Topo USA" and Microsoft "Streets"
for general reference and find that the easiest way to
get the file prepared is to set up the map on the computer
screen in whatever locale and magnification best fits the
purpose
and then simply use "Print Screen" to capture the depiction
in
"Paint."   Once the map is in "Paint" you can save it as
a ".bmp" file.   Since the upper left and lower right
lat/lon are easily obtained for either application
("Streets" through "Tools" and "Topo" directly)
the requisite companion ".inf" file can then be created in
"Notebook" following the format in the Ui-View
Help instructions.

Once the ".bmp" and ".inf" files are added to your
Maps folder in the UI-View application set, you are
ready to put your own favorite area depiction on the
screen.   I make a series of maps with increasing
degrees of magnification as an alternative to
the "zoom" feature.

I am even thinking about how to use the "3D"
feature of "Topo" which would give a visual
view of a station "BEACONet-ing" from some
altitude! That may not work but it is worth
a try.

Regards,

Ed

kc5dui@hotmail.com writes:

> How did everyone else do today?

Total opposite of last weekend. I shut down from about 8 PM Saturday to 9 AM
Sunday. From Friday to this morning (Monday) 7:00 AM The only station heard
is KG4EYO on 2 meters. He is about 120 miles from me and it takes some form
of band enhancement to receive his beacon. I do receive him every day usually
from about 4 am to about 9 am then spotty through the day.

I did notice two South American stations in the zoom window but they were not
using BEACOnet protocol or at least not at the time I received their signals.
I am working on a spanish version of BEACOnet setup to TX to them. I tried
E-mail twice (in English) but no response.

To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-13761-2001.05.21-06.50.05--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi gang,

After being off the air for about a week, I *finally* got my HF setup working in PSK31. I used to be
able to listen on 28.128, but not transmit. (I was lacking an extra COM port for PTT control, which I
installed yesterday afternoon.)

A couple of questions:
1. Is there any Beaconet/psk31 activity around this frequency at all? The last weeks that I have been
listening were very unsuccesful!
2. I see several people use PACKET on 10 meters. Is that 1200bps or 300 bps? Is there any way I can run
that over the soundcard? Which program is best and allows me to interface with UI-View?

Although the (HF) antenna used to work pretty well for me, I'm thinking about building a monoband
vertical for 10 meters. That should be better.

So my current "virtually" 24/7/365 setup is:

QTH: Brighton, MA (part of Boston) [FN42KI], about 200 ft ASL
Computer: Dell P2/200, UI-VIEW 2.36, PSK31Srv 1.08, Dell soundcard, KPC3+ v7 in KISS mode
HF-TRX: IC735, 40 Watts, Hussler mobile vertical 3-bander (to be replaced by groundplane in future)
VHF-TRX: IC32e (HT), Mirage B34, 25 Watts, Comet mobile vertical (to be replaced by groundplane soon)

73s,

Ramon W1/PA3EUG

Rendered body type: text/plain

In a message dated 05/21/2001 7:32:57 AM Eastern Daylight Time,

Hi Raymon and welcome to BEACOnet.

> A couple of questions:
> 1. Is there any Beaconet/psk31 activity around this frequency at all?
>

Yes, and no. BEACOnet^31 (psk31) The frequency used is 28.131 there is no
activity right now but I think some stations will be starting up this week.

2. I see several people use PACKET on 10 meters. Is that 1200bps or 300 bps?
Is there any way I can run that over the soundcard? Which program is best and
allows me to interface with UI-View?

BEACOnet runs at 1200bps. There is a program called AGWPE that interfaces
with UI-View nicely and will allow you to run sound card packet. I don't have
the URL handy but I think I found it by using a search engine just type in
AGWPE. You can also check out the BEACOnet web site. Ev has links to lots of
good stuff there but I do not remember if AGWPE is there. You should go have
a look anyway. The web site will help answer a lot of your questions. I print
out the text as needed so I can look back without getting on line.

<Although the (HF) antenna used to work pretty well for me, I'm thinking
about building a monoband vertical for 10 meters. >

W2EV, Ev just told us he is using a vertical dipole (center insulator) made
from a S0-239 and held up with a clothes pin :-)) and it works well for him.

If you get stuck feel free to E-mail the group. We will be glad to help.

Hope to see you fishing on BEACOnet soon. BEACOnet URL =

Hi,
I sure wish we had a FINDU for beaconet. i wonder if the "spotty" receptions during the day are caused
by jets traveling to/from ATL (busiest airport in the world is located between us in Atlanta). i
remember that you first made that propagation mode suggestion awhile ago. There are web sites that plot
 ACARS airplane info just like APRS. It would be fun to correlate beaconet reception reports with
aircraft. i've been operating meteor mode to catch the interest of newcomers that might tune in
following Ev's article in QST. So there probably are two different propagation modes operating between
us based on time of day.

Respectively submitted,

Wm Seffens

Hi Bill

I was wondering if you were seeing the same thing on your end. If you want to
experiment with air plain scatter I could do a simple test on my end that
should at least to a certain degree answer the question (Are we bouncing of
something metal in the sky)? I can set up a 13 element beam about 20 foot off
the ground point it at you and run meteor mode (zone 4) @ 35 watts. I don't
think that 35 Watts will bounce of off a meteor. It should bounce of off
aluminum? If you want to try this idea let me know and Ill see what I can set
up for the weekend.

Maybe we should use PACKET to do all our communicating!
That would force the use of plain text for certain.

Hi,

I have followed the instructions below but have a question.

In the Setup | Digipeater Setup

I dont have a Hopn-n option

it only give me a Widen-n or Tracen-n option.
Which one do I use or do I have the wrong version
of UI-View. It says version 2.32

Regards,
Steve

Subject: [propnet] Do this A.S.A.P.

Do you want to add functionality to your UI-View experience? Do the
following and you will be able to be a digipeater for others to use,
should the band open. Why would you want to do that? Check out
http://go.to/BEACONet | Participation | Successes | 10-m Very Cool!

This applies to all BEACONet-ers, not just those on 10-meters. Please
take the time to do this.

Ev, W2EV
Thanks to the eagle eyes of several BEACONet-ers who brought this stuff
to my attention. Sorry for the delay in getting it back out again.
Yes...there's even more after this, but let's do this first. I'm
thinking of writing an ARRL Web Extra article as a followup to clarify a
few things.

- -

Exit from UI-View and edit your UI-VIEW.INI file so that it shows the
following entries:

[DIGI_OPTIONS]
UIFLOOD=
UITRACE=HOP

Notice: this is different than what was printed in QST. There is no
hyphen in UIFLOOD or in UITRACE

Now, start UI-View and set the following parameters:
Setup | Station Setup
 Unproto Address = bsnpah-#,HOP1-1   (where bsnpah-# is your
                                       configuration code)
 Add UI-View Tag = X

Setup | Digipeater Setup
 Enable digi = X
 UI Only = X
 HOPn-n = X
 Alias = your callsign
 Sub Alias = your callsign
 Dupe secs = 60

Setup | APRS Compatibility
 No UI-View Extensions = unchecked

I'm still having a devil of a time getting on ten meter Propnet! I'm told
to use USB, with a 1500 hertz tone. Well, 1500 hertz is meaningless! We
must know what tone is required, preferably MARK, so that the transceiver
dial indication can be determined. The PK232 responds to 2125 Hertz MARK.
     I've tried moving the dial 625 hertz lower but no luck. Just what
does 1500 hertz mean? The 1200 baud packets are just too fast to tune to
using the front panel display. Any help on this?? Cliff K7RR

Not a bad day today. Plotted W2EV, WD4RBX and K9ER down in South Texas.
This is really interesting as I never hear south Texas here on Tucson.
K9ER's beacon lasted around an hour at 1830Z. WD4RBX disappears around
1900. It is now 2110 and I still have W2EV showing but I just tried to ping
and no return. I've also heard a few of our friends, south of the boarder,
using FM and what I thought might be someone using PSK31.

The [DIGI_OPTIONS] section controls what you see in SETUP | Digipeater
Setup. If UITRACE=TRACE, then you get TRACEn-n in the box (this is bad
for BEACONet operation). :o) Make sure UITRACE=HOP and UIFLOOD is blank
after the "=".

> -
>
> Exit from UI-View and edit your UI-VIEW.INI file so that it shows the
> following entries:
>
> [DIGI_OPTIONS]

> UITRACE=HOP

Once you have made these changes to UIVIEW.INI, then the option for
TRACEn-n will change into HOPn-n, and you're home free.

Hi Cliff,
We've got two different communities of experimenters playing, and it's
getting confusing.

BEACONet^31 is PSK31 based, and uses the 1500 hz tone you refer to.
BEACONet is AX.25 based and is what you will use your PK232 with.

So...tune to 28.128 USB and use your PK232. Tuning at 1200 baud isn't
so critical as to have to know what the mark and space tones are. If
you just setup as described above, you'll see results.

Be careful though...be sure to use "VHF" mode, even though you are on
HF. 10 meters is the only HF band in the USA where 1200 baud is
allowed, and it uses "VHF conventions".

Don't give up on us, Cliff....you'll get it transmitting soon! :o)

I have followed the directions
I have Streets And Trips.

My Question
Streets and Trips show lat and long as 42.89655n eg.
What would this be in deg.min.sec as needed in the inf file.
Is there a way to convert this?

Regards,
Steve

Sent: Monday, May 21, 2001 6:10 AM
To: TAPR APRS PropNet Discussion Group
Subject: [propnet] Personal Maps for UI-View

For the general benefit:

Very quickly I found that I wanted to add my own favorite
maps to the UI-View Maps files. The instructions in
UI-View "Help" get you there fairly easily.

I use both Delorme "Topo USA" and Microsoft "Streets"
for general reference and find that the easiest way to
get the file prepared is to set up the map on the computer
screen in whatever locale and magnification best fits the
purpose
and then simply use "Print Screen" to capture the depiction
in
"Paint." Once the map is in "Paint" you can save it as
a ".bmp" file. Since the upper left and lower right
lat/lon are easily obtained for either application
("Streets" through "Tools" and "Topo" directly)
the requisite companion ".inf" file can then be created in
"Notebook" following the format in the Ui-View
Help instructions.

Once the ".bmp" and ".inf" files are added to your
Maps folder in the UI-View application set, you are
ready to put your own favorite area depiction on the
screen. I make a series of maps with increasing
degrees of magnification as an alternative to
the "zoom" feature.

I am even thinking about how to use the "3D"
feature of "Topo" which would give a visual

view of a station "BEACONet-ing" from some
altitude! That may not work but it is worth
a try.

Regards,

Ed
W3NRG

The easy to convert that is to use the windows calculator. It has a
facility built in to convert between dms and real numbers. You must enable
the scientific option for these facility to be displayed. Enter you number
in the calculator window, then click the dms button. This will convert the
real number to a dms type of number. In this case we get 48.534758 which is
actually 48d 53m 47.58s You can also convert the other direction by
entering the dms number as dd.mmssss and clicking the invert check box then
dms. You now have the real number representation of the dms geographical
coordinate. Neat!!

Rendered body type: text/plain

Hi all,

I've encountered some trouble. After configuring my TNC (KAM'98) for
VHF packet, ie,

hbaud 1200
mark 1300
space 2100
etc.

I find that I can no longer beacon on 147.585. The noise or whatever
interference is on that channel is such that the 'receive' light on
the TNC is always on; thus, it does not transmit. Attenuating the
receiver (via an attenuator on an IC706MKIIG) does not help, but
if I change the hbaud back to 300, it starts to transmit again. Also,
tuning to a quiet channel sometimes helps, though the whole 2m band
here seems to be suffering from the same noise. It sounds like an engine
revving far away, though strangely it doesn't add any S-units to the
background.

I'd appreciate any advice on the matter. I'm running v.2.32.

Thanks,
-Robert
KG6CFZ

Rendered body type: text/plain

Hi, Steve,

I see one other input on the network in
response to your question as well.

I am still experimenting myself but here is
what I can respond with to this point:

#1. 32 degrees 15.98 minutes North
117 degrees 41.87 minutes West
should be entered into the Notebook screen
as "32.15.98N,117.41.87W" (no quotes)
according to the UI-View Help instructions.

At least that is the way I am doing it.

#2. If I find that in the transfer process I have
put my location a bit off from where I should
be on the map, I "tune" the ".inf" inputs using
the algortithm:

 . my location too far to the left on the map,
  add equal amounts to the longitude numbers
  in the ".inf" files

 . my location too far below on the map,
  subtract equal amount to the latitude numbers
  in the ".inf" files

(and, of course the reverse as required.)

You can estimate how much to add or subtract
by using the cursor to move from where your
station is showing on the map to your proper
location and watching the degrees or minutes
of movements at the lower right on the screen.

Not perfect, I will agree, but seems to get
a final result that is pretty close.

#3. The best way, of course, would be to use an
"application converter" to move from the
"Streets" application to ".bmf" or ".gif" and
I have such a program but have not had
time to beat it into submission yet!!

Hope this helps.

73,

Ed

Hi Robert,
Two things come to mind...
Before launching UI-View, issue the CD SOFTWARE command. This will
allow you to operate with "open squelch". Alternatively, squelch your
receiver, rather than attenuate. The CD SOFT command is a better
alternative.

Otherwise, I'd give Kantronics a call to see why the hash is generated
under the mode that you are choosing.

Rendered body type: text/plain

An interesting reply from the author of UI-View. It provides more
detail that may have some interest to folks here, so I snipped the
important stuff and included it, fyi.

Ev, W2EV

APRS uses degrees and decimal minutes, so the UI-View INF files do the
same thing. Example INF file:-

9.47.2W, 57.12.4N
5.47.3E, 50.18.1N
Great Britain

9.47.2W = 9 degrees, 47.2 minutes West
Etc...

The Streets and Trips 42.89655N is decimal degrees, so all you need to
do is take the decimal part of it - 0.89655 - and multiply it by 60 to
give minutes.

0.89655 * 60 = 53.793

So in the UI-View INF file you would put - 42.53.793N

A couple of other points:-

1. There's a section in the help file called "UI-View Maps" that tells
you how to make maps.

2. Many of the CD atlases have an option to display the longitude and
latitude in different formats. I don't know whether than applies to
Streets and Trips, but it might well do, so I would suggest checking
through the menus to see if there is an option to display it in the
format UI-View needs.

On a related topic:-

About a year ago, I looked at adding support for the Precision Mapping
CD (Chicago Map Corporation) to UI-View32. I contacted Chicago Map Corp

about the cost of the development tools, and got no reply. I tried
again, and got a reply that made me think that either they hadn't
understood what I had asked, or they were trying to tell me to get lost!

Ev & Robert,

There is a THIRD possibility!

_/_C_A_B_L_E_ _ _T_V_ _ _L_E_A_K_A_G_E_/_ !!!

Robert, you should contact your local cable companies _MAIN_ _SWITCHBOARD_
(NOT the sales weenies) and ask to speak to the "SYSTEM SENIOR ENGINEER".

Tell them you are hearing cable leakage and at times are able to recieve
cable channels with JUST an antenna while not using a cable subscriber box.

Good luck, I ended up having to go through the ARRL to get taken seriously
by the local cable company here. Try locally first, if that fails let me
know here.

Hi all
I ran my BEACONet on 28.128 all day yesterday for the first time.
(From Titusville, Fl. EL98on) I only showed one station at the end of
the day, N7YG in Arizona. I also could hear a number of sounds which
sounded like packet, BEACONet or APRS but nothing showed up. Any idea
what they were?

Terry
I also head the same thing and as hard as I tried to decode that stuff, I
did not succeed. I did noticed a few 'mis-guided' CB'ers that were also on
28.128 using AM with those idiotic 'roger beepers'. After I cranked the
power up to 100 watts, I guess I got their attention and they switch to FM.
That made it worse for them, so they finally went to another frequency.
There was also another station I heard that sounded like packet, but I do
not believe their tones were adjusted properly. I did try and tune off
frequency a bit but no luck.

I will not be on the air today. I will fire things up when I get home from
work around 0030Z.

PS: Terry, that is a neat email address, are you involved with flying??

Hey Cliff...

I use a PK232 on 28.128. Just set the dial to that freq, USB, and make
sure the PK232 is set for VHF ON and HB 1200. If you are using a radio
with digital readout, you should be right on the money. Also make sure you
don't have any filtering in..notch, if shift, etc.

Rendered body type: text/plain

Hi guys,

I moved my station from 28.127 to 28.131, transmitting at about 1,500 Hz (so
the effective frequency is 28,131.5 kHz -- is this where you folks will be
at?)
I really like Beaconet/PSK31 a LOT MORE than packet based, for the following
reasons:

1. I can use both Beaconet/PSK31 on 10 meters and Beaconet/packet radio on 2 meters. I didn't see any method of configuring UIVIEW to work with AGWPE and a TNC at the same time
2. I installed AGWPE as suggested by Rich, but there doesn't seem to be a way to decently tune this program on HF. (no spectograph, waterfall, or anything). Furthermore, for some reason, my IC735 gets "stuck" every time I try to transmit with a little more than 20 Watts in FSK/Packet. Probably HF related, but with PSK31 I never had this problem. (I've had it before when I was using a very mismatched antenna or a "wire" starting at my tuner).
3. I could turn things around (use the KPC3+ for HF and AGWPE for 2 meters). But then I would have to re-do all my cables, connectors, etc. and I just don't feel like doing that for now :-)

So, I'm back "quasi" 24/7/365 in Beaconet/psk31 on 28.131. Band seems a little dead lately, but my antenna could be to blame. As said, I'm working on the antenna solution.

Any suggestions are welcome!

Ramon W1/PA3EUG [FN42KI]

Rendered body type: text/plain

Ev and the group. In order to find the correct tuning point on 28.128, I
listened to a handheld tuned to 144.39----the APRS frequency using 1200
baud FSK signals. Then I tuned the HF receiver for a match. I found this
to be a dial reading of 28,127.9 which is a good match!. There have been
many very weak signals there but no print. The conclusion then must be
that I need far stronger signals in order to get results. If anyone
prints my type one signals, let me know. When all this is done, I then
can provide a parameter set up for a PK 232.
     Since PSK31 requires less signal to noise, let me try that today. I
have to justify my call on your website Ev! How many PSK31 signals are on
presently? I take it they use 28,131.0 as a center frequency? Cliff K7RR

Side note to Ramon...

I copied you out here pretty solid about 45 minutes ago..band seems to
have shifted again, though. How often are you sending
beacons?

325. [propnet] W0IBM on 10 meters

From: "Tony Drumm" <drumm@us.ibm.com>
Date: Tue, 22 May 2001 14:08:20 -0500
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-14149-2001.05.22-14.27.40--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have our IBM Rochester, MN club station, W0IBM, up and running on 10m.
We're using a PK232 and an Icom up to an omni on the roof. Let me know if
anyone hears it. I do think we need to look into the frequency issue a bit.
PK232s don't use the same mark/space frequencies as most other TNCs (1700
Hz, I think), so the radio setting will need to reflect that difference.
I'll dig a bit more into this when I get a chance. (There's a paragraph
about this in Bruninga's HF.txt document for DOSaprs.)

326. [propnet] AGWPE Question

From: "AK3E" <rick@iximd.com>
Date: Wed, 23 May 2001 05:02:05 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-14158-2001.05.22-16.23.51--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just completed getting my tnc(kp3) and UI-View working with AGWPE. I was
originally just using the TNC and UI-view. The reason I changed is I want to
continue beaconing on 2m with the tnc and also on 6m with the soundcard thru

my Rigblaster interface. Question is, is it possible??? I had to change some
of the settings to get my tnc to work from what is asked for in the
soundcard instructions.
Thanks Rick AK3E

I'm sending my PSK31 beacon every 5 minutes... good to hear that at least
somebody hears my station once in a while!

Thanks,

Ramon W1/PA3EUG (PA3EUG>HY1F0A-15 [FN42KI])

On Tue, 22 May 2001, Clifford Buttschardt wrote:

Ev and the group. In order to find the correct tuning point on 28.128, I
listened to a handheld tuned to 144.39----the APRS frequency using 1200
baud FSK signals. Then I tuned the HF receiver for comparison. I found
this to be a dial reading of 28,127.9 which is a good match!. There have
been many very weak signals there but no print.

```
****************************
Ev and the group.  Finally some signals strong enough to print came in:
WD4RBX*>hop1-1>HY1E-15:
[EM84NM] {UIV32}
This station came in from 1908Z to 2015Z

Apparently, then, a very large signal to noise ratio is required.
Unfortunately there is two other stations equally loud by highly
distorted.  One is obviously an overdriven situation--broad and
spattering.  The other station is loud at the beginning of the packet
and then distorts at the end of the packet----probably again over driven.
Most 100W peak amplifiers need to be limited to one third SSB peak or
about 35 watts.  A third station is 50 percent hum!
     I've been broadcasting at one minute intervals at 07 seconds past the
minute in an attempt to get a reception report,  Anyone print?  Cliff K7RR

Tony, I am sure that we PK 232 owners need to make a slight adjustment in
the transceiver frequency to join the Kantronics guys on 28.128
The PK 232 uses 2125 and 2325 Hertz as mark and space frequencies. We
first need to ask the Kantronics guys what mark and space tones they use
and then tune the transceiver to those tones. Here is the PK 232 settings
I finally found useful using PROCOMM as a dumb terminal:

```
reset
mycall K7RR                       change to your call
expert on
btext [CM95ni]k7rr@arrl.net       change to your grid and URL
unproto HY0F03-15                 change as necessary
beacon every 60                   60 for ten minutes, 6 for every minute
hbaud 1200
passall on
```

I may have made some configuration mistakes as I've not attempted to
repeat through anyone as yet, but the basic commands seem valid.

Let me add a little confusion to the issue of the mark/space frequencies...

It's true that the KAM and PK use different mark and space tones -- for
300 bps HF. Kantronics uses 1600/1800 for mark/space, AEA and MFJ use
2125/2295.   Think about this...if we didn't all have the same tones and

shift on VHF (read 1200 bps), we'd never be able to communicate between ourselves on VHF FM. Ergo, everyone using 1200 bps uses the same shift (1000 hz) and the same mark and space tones (1200-2200), and the same bandpass center - 1700 hz. If we all get on 28.128 and run 1200 bps, regardless of the tnc, we'll all be on the same spot.

73!

Doug I disagree! It depends on the setting of the discriminator in the TNC. Further, the tones being received in FM do not change with tuning but in SSB they do. I made some careful checks with the PK 232 and found in the VHF mode, the bandpass of the entire system was 580 to 2750 Hertz which means a center of 1665---exactly as you indicated!
     But here is the rub. The transmit tones are still 2125 and 2325 since they are created by a tone generator in the PK 232. Therefore, I think that the transceiver should be tuned to 28127.475 to offset this.
     All the ten meter signals are gone this late in the day, but I will

put the system on 28127.475 about ten AM Pacific tomorrow. (I have a sked
on 40 meter before that!) I agree that this should not make all that much
difference, but with marginal signals we need all the help we can get.
     The only real answer to this is to realign the PK 232 to a center
frequency of 1700 Hertz and conform to commercial standards and of course
bring the transmit tones along with the discriminator. I have those
conversion instructions if anyone is interested in that modification.

Ev, you just showed up on my screen at nightfall----0230 UTC!!
On the PK 232, all we need do is add the command VHF on to the command
list. It comes up default but does no harm to be sure!
     BYW, I made a mistake suggesting tuning lower in frequency to use the
PK 232. I found a misadjustment in my unit. Cliff K7RR

```

Hi Cliff...

For 300 bps, you ARE correct regarding the transmit tone frequencies. However, the 1200 bps tones are 1200 and 2200, this being the Bell 202 standard that all (well, most) VHF packet uses -- and puts the 1700 hz VHF bandpass center exactly between the 1200 hz mark tone and the 2200 hz space tone. It has to be this way because bandwidth increases with keying rate, and a 1200 bps signal won't fit in a 200 hz shift without playing games like multi-level PSK encoding. All tncs have to be the same at this rate because there's no way to vary the received tone frequency on channelized fm..doesn't matter if you are on 144.39 or 144.395, you'll still hear 1200 and 2200 audio tones, just with noise if you aren't one the exact frequency. There's no bfo to shift the tone frequency, so we are all parked on the same bandwidth, shift, and mark/space pair.

On the other hand, with 300 bps on hf, as you say, you can tune the mark and space tones to be whatever you want. My PK232 book says the HF bandpass is 450 hz, consistent with 170 shift tty, 200 shift packet, etc. Why AEA put the HF packet bandpass center at 2210 rather than at 1700 like the KAM probably relates to the chip set they used in the PK232. As long as the tncs all use 200 hz shift, we could have one with 1600/1800 (Kam), 2000/2200, 2100/2300, 1500/1700, or whatever, and the operator can compensate for the shift by tuning to whatever frequency fits in that tnc's passband.

An interesting experiment to try would be to see if a KAM can talk to a PK232 at 300 bps on VHF. I'd bet it won't work since the mark and space tones are something like 300 hz offset between the two tncs.

Doug
K7IP

PS...I'm really enjoying this discussion..haven't thought about it in a long time, and for the past couple days I was also convinced that the frequencies were different depending on what tnc was being used.

At 18:17 5/22/01 -0700, you wrote:

Hi Tony!
It's good to have W0IBM BEACONet active. You were my first 2-meter
meteor reception a couple of years ago...now I'm looking forward to
seeing you on my 10 meter screen soon.

Interestingly enough...earlier today I met with the local IBM marketing
fella to talk about the replacement for my AS/400-520. :o)

Welcome aboard!
Ev, W2EV

Doug and the group. My last message to Doug regarding shifting the
transceiver downward in frequency is wrong, WRONG! The proper frequency
as outlined by Doug is correct. My transmit frequencies are misaligned
as I just found out by putting a counter on the transmitter output.

Another possible fault is my specific unit that has a DCD modification.
This was a TAPR kit available many years ago, probably to aid narrow band
operation---I can not remember.   Unless the incoming signals are spot on,
that light will not come on and nothing is printed.

Ev suggested making a page specific for the PK 232. Possibly we can add
the conversion information to change the old PK 232 to 1700 Hertz center
frequency. I'll convert one in the next few days to be sure..

Dan,
To run BEACONet^31, you will need two files:
PSK31srv and UI-View. Both files are available from the BEACONet
website.

I would suggest uninstalling both, then reinstalling PSK31srv first,
then installing UI-View.

Ev, W2EV

Ev and Dave,

Thanks for the suggestions. I tried the CD software command, and it now
works perfectly! Dave brought up an interesting possibility and one that I
had sneaking suspicions about when I started doing 6m and 2m stuff here. I
do tend to get into the cable here even at QRP. That and the fact that I
get this interference on those bands leads me to suspect that there may
be some faulty shielding on the part of the cable company.

Anyway, I'm back on the air on 2m, and in the process of building a
vertical dipole for 6m. Hopefully that'll be up by the end of this week.
Unfortunately, in order to make room for new antennas, I had to
re-arrange my existing ones, such that my 2m beam must point fully
north (or else I get into all my neighbors' TV's). So if anybody is
listening in northern California and maybe OR and NV, let me know if you hear
something!

Thanks,
-Robert

Doug, when all this "stuff" regarding the PK 232 is over, I'd
like to run some tests on PSK31 on 28.131, 1500 Hertz offset.
There is no doubt about frequency accuracy. The weak signal

ability of PSK 31 far exceeds that of any packet system!
     How much delay do we need to put into the system to be
sure the AFC tracks properly?   73 Cliff K7RR

Ev,

We've played on and off with meteor scatter since then, but not
successfully. I'm hoping to get our station working well with UI-View (so I
understand it like I do DOSaprs and WinAPRS). Then I think we'll be in
better shape to participate in meteor again. The club station can run from
160m to 1296MHz, so we should be able to participate in the whole range at
some point. Based on my available time!

The current operating position I'm using has both HF and 2m. Can I run both
at the same time (two different TNCs) in UI-View? If so, it would be easy
for me to get on the air on 2m, too.

Tony

P.S. Glad to hear you're using the best line of servers in the world! :)

10m.

Hi Tony!
It's good to have W0IBM BEACONet active. You were my first 2-meter
meteor reception a couple of years ago...now I'm looking forward to
seeing you on my 10 meter screen soon.

Interestingly enough...earlier today I met with the local IBM marketing
fella to talk about the replacement for my AS/400-520. :o)

Welcome aboard!
Ev, W2EV

Hi Cliff

Glad to move up there with you anytime you're ready. I don't change any of
the default settings on PSK31srv, just put in the call and status message
and go. Let me know when you have a machine set up for it, and I'll switch
for a couple of hours.

Doug

357. [propnet] hardware watchdog needed

From: Ramón F. Kolb <ramon@ieee.org>
Date: Wed, 23 May 2001 10:28:01 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-14305-2001.05.23-09.47.03--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Last night I had some problems, and I figured out that I need a hardware
watchdog for my PSK31 setup. Somehow (and that happened once before) I got
the "blue screen of death" in Windows with a "Drive D write error". I think
it has to do with the fact that my HD's switch off after a while, and then
are not fast enough speeding up. (My power saving scheme indicates that this
should "never" happen, is there some other place I should look?). Anyways,
the result was that (although luckily no audio was sent) my transceiver got
stuck in "transmit". This is not something I want to happen... so I need a
hardware watchdog. Probably a small circuit in the PTT line would suffice.
Any hints on where to look?

By the way, I'm still/again up at 28.131/+1500Hz in BEACONet/PSK31. Reports
are welcome!

Check this site out...it's a keying circuit that doesn't use the computer
ptt line, but is a vox-like thing that only keys if there's audio present
from the sound board. Kind of the same idea that TigerTronics uses in the
SignaLink (great little accessory, BTW, I LOVE mine).

If you use AGWPE, you should be able to get multiple TNC's or Soundcards
run into the same instance of UI-View - and, if I'm reading the UI-View
helpfiles right, you can specify which AGWPE port gets which message
for beacons. Note, I haven't tried this yet -- just read about it.

This is cool but it won't work unless I use the MIC IN soundcard input
instead of the LINE IN. I cannot find any way to stop my soundcard from
looping the "received" audio on the line in to the speaker output. Looks
like a soundcard deficiency (DELL P2/200 builtin soundcard) As a result, I
cannot use the trx VOX either (otherwise I'd done that long time ago...).
And the function of a watchdog is to restrict transmission time to say-1
minute, no matter what happens on the PC side...

It should be pretty easy, and I am probably going to look in the schematic
diagram of one of my TNCs to figure it out, since there this has been
applied long time ago...
By the way, if anyone is thinking to put up a Beaconet/PSK31 station more or
less stand alone on HF, I'd STRONGLY RECOMMEND a watchdog circuit. I'm not
that concerned about "harmful interference" on a band that is near dead
(although you would technically be violating the law by now ID-ing often
enough), but I'm pretty much sure that your transceiver and power supply
don't like hourlong operation at 100% duty cycle. So for your own
protection....

When I find something usable, I will post it here.

Dan, Doug,

yes I tried all that.... it works for the Microphone Input but not for
Line In. Now, the audio characteristics for Mic In are different from
Line In, it seems that Line In has better strong (AF) signal
characteristics than Mic In. But if everything else fails, I can always
revert to that.

BTW, I *solved* the PTT problem by installing a new COM port in my
computer. This works pretty well. I want the watchdog because of Windows
Crash problems where the TRX stays keyed, which happened last night and
what could possibly be destructive to my transceiver and power supply.

At 04:24 UTC on 23-May-01 I caught one station using BEACONet
and UI-View. That station was W8SF-3, from Fairmont, WV. I
think that's about 75 or 80 miles from my location. W8SF-3 is a
repeat catch, but a catch none the less.

Hi Dave,

Although I'm not the list manager, some comments here:

This is a TAPR mailing list problem. Real mailing lists (unlike this one)
parse emails and convert them to HTML or plain text as configured by the
individual list subscriber. Most of us access email from the internet,
myself included (using Outlook Express). I personally don't have any problem
with HTML mails (actually, the formatting makes it better to read in a lot
of cases).

So no, I don't see HTML markup as an abuse. It's pretty much standard
nowadays and almost everybody uses it. I suggest you upgrade your email
reader software... Now if the mail volume is to big for you, you can always
subscribe to Digest delivery only (go to the TAPR website and log in to the
mailing list to change your settings).

Having said that, it does mess up the Digest format. But that's something
that we need to take up with the list software writer (Lyris) (so the
listserver allows email parsing) instead of blowing steam to the users.

If individual email senders want to send plain text instead of marked up
mail, they should check the following:
- For those that use Outlook or Outlook Express that want to send in plain
text, go to the Format menu in the message and see that "Plain Text" is
selected.

- For those that use Netscape Mailer, go to Edit -> Preferences -> Mail &
Newsgroups -> Formatting and select "Use the plain text editor...." here.
(other mailer programs have similar features.)

Cheers, and lighten up...

Ramon W1/PA3EUG

372. [propnet] 28.128 activity on 5/22

From: "RWeinkauf" <rweinkauf@msn.com>
Date: Wed, 23 May 2001 17:18:13 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-14400-2001.05.23-16.38.41--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Just got home and looked at my UIView screen- and saw I had some activity yesterday evening:

2001-May-23 17:14 9 stations

Callsign	Type	Latitude	Longitude	Miles	Bearing	Last Heard
+N8QLT	Grid Squ.	[EN82HL]		0.0	0	May 23 17:14
+LU7DAC*	Home	34.33.74S	058.31.92W	5522.8	159	May 22 20:38
+LU3AVO-2	Home	34.36.33S	058.31.09W	5525.9	159	May 22 20:33
LM3AVO	Grid Squ.	[GF05RJ]		5525.4	159	May 22 19:39
LU3AVO	Grid Squ.	[GF05RJ]		5525.4	159	May 22 19:32

Looks like LU3AVO was having a little trouble getting his callsign into the TNC. Time are EDT, and
LU7DAC was heard through LU3AVO-10.

It does?

Usually I need a magnifying glass to read the HTML emails - and I'm only
30 years old. I prefer to set the size of the text and colors to suit my
own tastes. I've found some of the recent postings to the list with
multiple fancy fonts and text colors quite annoying (certainly not
easier formating), and they often quickly go into the trash. Thank God
most people don't use the <blink> attributes </blink>.

>So no, I don't see HTML markup as an abuse. It's pretty much standard
>nowadays and almost everybody uses it.

Who exactly is *everybody*? I see less than 10% of my hundreds of daily
emails arrive at HTML, and it is usually those select few that think it
is "standard".

> I suggest you upgrade your email
>reader software...

The mail program has nothing to do with annoying emails or my opinion.
I'm using the latest Microsoft LookOut! Express mailer. Of course, much
of the problem is these mailers default to html.

I agree 100% to David's four points.

73,
Tim

For those of you who don't care whether or not a message is HTML formatted,
I've created a yahoo mailing group. Feel free to participate as you wish,
without fear of criticism as to your chosen method of text presentation:

Post message: propnet@yahoogroups.com
Subscribe: propnet-subscribe@yahoogroups.com
Unsubscribe: propnet-unsubscribe@yahoogroups.com
List owner: propnet-owner@yahoogroups.com

For this group, I believe I've found the switch to make everything text.

I take a day to go to work, come home and wade through 244 eMail
messages...and am greeted with anarchy. :o)

Folks, there are things to get upset over. HTML in an email isn't one
of them (binaries, on the other hand...hmmm). If this list degenerates
into the same name calling self righteous crap I see on others, I will
pull the plug on it and go back to finding something else to have fun
with.

Splinter to another list provider if you feel the need. For now, I (and
my Elmering) will remain here. I need to subscribe to yet another list
like I need another rust hole in my 1982 Oldsmobile Cutlass Diesel.

Ev, W2EV

dang thing still gets me to town, though. :o)

Hi Dan (and anyone else interested),
Here's how things work...maybe this will help...

===== BEACONet^31 [28.131 USB using PSK31 "rtty"] =====
Run PSK31srv first. As a matter of fact, it will have a waterfall
display, and a method of carying on a QSO using PSK31, if one chooses to
use it in that way. Read the help files for full-blown operation along
with UI-View. PSK31srv acts like a web-server, relaying information
to/from UI-View. It's a brilliantly implemented product.

Afterward, launch UI-View and "connect" to the PSK31srv "web server"
that ought to be running on your system.

Insight: PSK31srv should function all by itself. Test it on 14.070 by
engaging in a few PSK31 qso's. If it errors-out, then something is
conflicting with it. It is not a problem with PSK31srv.

===== BEACONet [28.128 USB using AX.25 packet] =====
Use UI-View and a KISS capable tnc (no PSK31srv). Follow the
instructions for setting up a "Level II" station, found at
http://go.to/BEACONet | Configuration | Level II.

It sounds like there may have been a mix up in terminology between our
^31 and non-^31 operation. Keep smilin', we'll get you there
eventually. :o)

Hi Ramon

I am sticking with BEAConet for a while longer so the new comers that start out with AX25 will have some stations to fish for. I did monitor BEACOnet^31 for a while today and pointed my beam south (almost directly away from you) and was able to get parts of your transmission. I am giving a great deal of though to permanently switching to BEACOnet^31 because I am being bombarded by an almost constant stream of traffic from LU3AVO 2 meter gateway. It's really not to bad because he does not open his gateway till around 6 PM and the TE stops around 8 or 9 PM and I can start fishing again.

Good fishing

Roman

The watch dog idea is pretty simple. Setup a 555 timer circuit in a monostable configuration such that when you key the PTT line it sets the output of the timer low and after the preset time, say 10 minutes, it flips states and the output goes high, unkeying the transmitter.

Seems we are not alone on 28128.0! Maybe some of you can interpret this:

```
2100Z   $6628.4513 [C] 37 79 43 E4 36
2150    LW3DJC-13*> {9] R9:
2200    $5325.4B07 <DM>
2240    LW2DCD>LU3AVO-10*> APU16K:
        :LW@EOV-3 : ACK 50
2300    LU3AVO-2*>LU3AVO>HOP2-2>WD4RBX
        "HELLO RICH////~28
2315    LW2DCD>LU3AVO-10*>APU16K:
        :LW2EOV-3 : ACK53
```

No signals after 00 UTC which is 1700 Pacific time. Maybe we will see
you again Ev, tonight! Cliff K7RR

Hi Ev: Well I just tried to run Psk31 srv....and I keeping getting this error

   "Run time error 429"

   "Active x component cant create object" Everything halts

I guess this may refer to the app shortcut I have never seen this before in any programs....any ideas?

Hmmm. It seems that we have some Argentine activity...via a Gate to 2-meter APRS maybe? Well, signals are signals! :o)

I just checked my screen and have similar stuff. Man, am I glad that BEACONet conventions are different than APRS conventions. Our frequency would be filled to capacity with world-wide digipeats if everyone here responded to the RELAY alias. It would be bedlam. :o)

I'm seeing a lot of propagation to the south, but not much E-W stuff. Probably because of that stream of solar wind we seem to be traversing right now. I LOVE this stuff. :o)

391. [propnet] Beaconet^31 setup and PSK31Srv suggestions

From: Ramón F. Kolb <ramon@ieee.org>
Date: Thu, 24 May 2001 10:54:44 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-14541-2001.05.24-10.14.00--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi guys,

I've been thinking about my Beaconet^31 setup. As usual, let me summarize my thoughts in bulletpoints (sorry, just a professional habit :-))

- PSK31Srv startup problems. I've seen several people complain about problems with PSK31. Although some of them sound like Active-X problems in UIView (we should ask the UIView author (he can be reached via the ui-view@yahoogroups.com mailing list) about the Active-X requirements for UIView), I have a different issue and a work-around. My boot-sequence is the following: switch on all hardware (PC, PS, TNC, trx's, etc.), start UIVIEW and PSK31Srv (in any order), then say "connect to APRS Server" in the action menu of UIView, then press "F9" to transmit the beacons to see if everything works. Result: on 2 meters this works fine, but no text is being sent to PSK31Srv. Solution: fake an entry in PSK31Srv, send that to UIView, and retry sending the beacons. Most time this works. If you don't trust the connection, you can always do a Start->Run and type "telnet localhost 3131" to monitor the communication between UIView and PSK31Srv. (I've wondered how that works, because by doing this telnet, you can't be listening in on the link between the two programs. My guess is that PSK31Srv echoes whatever it hears on one socket to all the other sockets that are connected.)

-PSK31Srv auto-capture feature. It will ONLY auto-capture if it detects "DE AA0AA" (replace by your favourite callsign) AND a FULL locator between brackets (i.e., [FN42KI] is OK, but [FN42] or FN42 or FN42KI is NOT) in the SAME LINE. This is not standard UIVIEW behaviour. My solution is 2-fold. First, in PSK31Srv I'm putting " DE PA3EUG [FN42KI] - DE PA3EUG [FN42KI]" in the preamble text. Further, in UIView, I've put "DE PA3EUG [FN42KI]" in the beacon text. Unfortunately, I can't configure a separate beacon text for the APRS Server port, but this will do I guess.

-Station description in PSK31. It would be very good if we could use the "HY1F0A-15" format (or whatever reflects your setup) and have PSK31Srv support it in the communication between UIView and PSK31Srv. In general, it would be great if the "filtering" mechanism could be enhanced to allow for the following:
* detection of AA0AAA-12>AA1AAA-15 as two valid callsigns, which both should be sent to UIView (the second one instead of APUPSK that is now the standard receiver callsign. Note the use of SSIDs which currently are not supported by the PSK31Srv. Now we can configure UIView so it will send the "HY1F0A" string as part of the beacon text towards the APRS Server=PSK31 port: go to Setup -> APRS Compatibility and change the Unproto address to HY1F0A (unfortunately this doesn't support SSIDs yet-- we could ask Roger Barker for this as well).
* more generic locator captioning. It would be great if we could also capture APRS strings in addition to locators, but only if there was some setup option to switch this off. But it would be good if [FN42], FN42, FN42KI and [FN42KI] would all be supported. Right now I think only the latter is...
(Before we go off and kindly ask Roger Barker, the author of both UIView and PSK31Srv if he could look into this, we should probably agree on what the functionality we actually want. So let's discuss...)

    --Ramon W1/PA3EUG (still/again active on 28.131 in Beaconet^31... reports are welcome!)

SOLAR WIND: Earth is inside a solar wind stream flowing from a coronal hole on the Sun. Forecasters estimate a 20% chance of minor geomagnetic storming at high latitudes where observers might spot faint auroras near local midnight. Meanwhile, solar activity remains low. Active region 9463, a sunspot group near the center of the Sun's disk about the size of two

planet Earths, has developed a twisted magnetic field that likely harbors
energy for M-class solar flares.

Weak ssb signals on 28.128 here, but no packets so far this morning, drat.

Rich, you are more than right! I did not know what I was printing until
long after sundown when I converted to Pactor and printed page after page
of bulletins and Dx news announcements. The Pactor signal was optimized
just 200 Hertz lower than our Packet, Propnet effort.
     Seems I was fooled by this until signals built to a strong enough
level to determine that this BBS is there most evenings. Cliff K7RR

Found it. It took a little websurfing, but here it is.

What we need is a CD4538. This is a "retriggerable monostable
multivibrator", made by TI and Fairchild. Digikey (http://www.digikey.com)
has them in stock for about $0.80. For more info, see the Fairchild
datasheet at http://www.fairchildsemi.com/ds/CD/CD4538BC.pdf. Note that wat
we want to have is shown on page 4 in figure 3, probably the top circuit.
With Rx=1MOhm and Cx=100uF we should have a delay of about 100 seconds,
which is more or less what we want. If that's not enough, greater values of
Rx and/or Cx should be used: [watchdog time (sec) = Rx (Mohm) x Cx (uF)]. If
you use a circuit separator in your PTT line (such as the BuxComm kit, that
I use), you should probably put this on the computer side, and then use the
output to connect to the opto coupler. I'm thinking (electronics classes are

a few years ago) whether we could just use the DTR/DCS line to power this
circuit, this doesn't sound too difficult to do.

Again, if your station is stand alone, you SHOULD use a hardware watchdog
timer to avoid letting computer problems burn out your transceiver.

I'll report back if I get this thing to work, and the final circuit diagram
I used.

Roman

The watch dog idea is pretty simple. Setup a 555 timer circuit in a
monostable configuration such that when you key the PTT line it sets the
output of the timer low and after the preset time, say 10 minutes, it flips
states and the output goes high, unkeying the transmitter.

>position. What do folks use for large-area, world-wide maps? If we're going
>to do much with this on 10m, that seems to be sort of important.

Tony, what program are you using? If it's UI-View or UI-View32, you should have a map titled simple "The World". Let me know if you don't, and I'll send the necessary files.

I also have a world map available for WinAPRS, if you're using that program.

Hi again Ev,

Just checked on my system from here at work and found out that my Baycom Modem had one more hit on you at 14:13:44 UTC. Soundcard missed again but did digipeat your position. Can't check on the MFJ TNC until I get home as the old computer it is connected to isn't online. Nobody else is showing on the map or in the log. One of these days.....

Bob - KC5DUI - EM26WE

I am trying to get set up on 6m. I'm on 2m with UI-view, AGWPE and 1 KPC3.
That set-up works fine. I'm trying to get a 2nd KPC3+ configured for 6m. I'm
getting stuck with AGWPE, it keeps adding a 2nd port to the 1st tnc. How do
I add the 2nd TNC. Also will 1 version of UI-View run both tncs or do I have
to run the program twice from different directories?
Thanks Rick AK3E

>So no, I don't see HTML markup as an abuse. It's pretty much standard
>nowadays and almost everybody uses it. I suggest you upgrade your email

I prefer plain text, and the jpg files really mess up the digest as well!

Outlook Express might be the mail system that most people use, but it can
cause you problems if you are not careful. It's amazing how many people
catch and pass on Trojans and Worms by not realising that allowing OE to
open attachments is not a good idea! My good old copy of Eudora just keeps
going when the OE program has turned its toes up, yet again....

So, I think this Beaconet user will be unsubscribing rather than suffer the
HTML and unrequested jpg files.

Bye all.

de Dave (G0DJA)

Hi Rick

You got it. I have 3 copies of UI-View on 2 hard drives. I can run 3 beacons
Including BEACOnet^31 at the same time. Unless I want to use my sound card
for packet or psk31 I have no use for AGWPE. I have 3 TNC, s and a (Rascal)
PSK 31 interface. It gets a bit confusing until you get use to having 3
UI-View programs running. Hint, Make short cuts on your desk top and name
them appropriately.

Rendered body type: text/plain

Hi guys,

I just got home and... nothing. The band is wide open and I hear several LU
stations in PSK31 a little lower in the band. Makes me think that PSK31 is not
such a great mode for 2-way beaconing after all... but it could also be
because of my "scanning" settings in PSK31Srv. I had them set to 250Hz/3Hz/5Hz
(width/delay1/delay2). I just put it a little "less" wide, at 100Hz/3Hz/5Hz.
Maybe this is better.

Now here's the request: I had put them this wide since I have no idea what the
actual transmitting frequency is that I am using. Next time if anybody hears
me, could you please send me a display readout of my zero-beat signal, so I
can see how far I'm off from where I should be. Since my TRX is set to 28.131,
and I'm using 1,500 Hz tones, you should read 28.132.500 ... However... I'm
not convinced that my TRX frequency setting is very accurate.

So please let me know, and I will correct!

Thanks,

--Ramon W1/PA3EUG [FN42KI]

At 02:13 PM 5/25/01 -0400, AK3E blasted the following out into the ether:
>I am trying to get set up on 6m. I'm on 2m with UI-view, AGWPE and 1 KPC3.
>That set-up works fine. I'm trying to get a 2nd KPC3+ configured for 6m. I'm
>getting stuck with AGWPE, it keeps adding a 2nd port to the 1st tnc. How do
>I add the 2nd TNC. Also will 1 version of UI-View run both tncs or do I have
>to run the program twice from different directories?
>Thanks Rick AK3E

AGWPE handles this task very easily, connecting both TNC's to
UI-View32, WinAPRS, AGWTERM, and what have you.

Attached you will find 2 text files -- port0.ini and
port1.ini. PORT0.INI controls my TNC on 2 meters (COMM 1), PORT1.INI is
for 6 meters (COMM 2).

Hope this helps, feel free to use this as you wish.

Hi Ev,

Will have to check my "sent items" file and see if I have copies of the
messages I sent referencing the various copy statistics.

Have another one to add in - my MFJ TNC showed ONE hit on WD4RBX at 1948UTC
while the Baycom had FOUR items between 1948-1502UTC. On the other hand,
the MFJ TNC Terminal screen listed LU6AFJ at 2223UTC and LU3AVO at 2237UTC -
neither one had GRID info so nothing plotted on the map. During all this
the soundcard received nothing but seems to do a GREAT job on xmit. Maybe
if activity picks up and lots of packets are coming across I can play some
more with the volume level for the soundcard and see if I can make some
improvements. Otherwise I'm going to need to make a 'complete' cable for
the Baycom so it can ack the messages coming in (received a message from
WD4RBX but since the soundcard didn't receive it the message was
acknowledged).

Plan on switching to BEACONet^31 for Saturday and maybe Sunday depending on
how things work out.

Bob - KC5DUI - EM26WE

Rendered body type: text/plain

Tonight, 25 May, there we many loud, non Propnet signals on
28128. I switched to the Pactor demodulator using 28127.8 USB
or 28132.2 LSB which indicates the center frequency is 28128.0
     You know about the Argentines but there is a Pactor
WINLINK station there---VK8PDG. He sends bulletins of
interest
and handles traffic for the area. An announcement was made
that Official Broadcasts would start on 1 June Friday's only.
    Another point of interest is he is advertising for PK 232
older units capable of Pactor. Contact VK8PDG:
VK8PDG@australnet.com.au   or   petergiles2@hotmail.com
    Lots of other interesting stuff such as the Voice of Khmer
Krom Radio and a Belgium short wave transmitter supplier.
Obviously, they seem to be on 28128 to stay. Cliff K7RR

Hi,

nothing rx'd here the last 2 days on 28.128. I usually
see a few but nothing. My station is on 7x24.

Hi Wayne,
I wonder if things are setup correctly or not. QSY to 144.39 (the APRS
frequency) and lurk for a while. BEACONet should decode APRS fine. If
it doesn't, then go back to square-one (starting with reset of your TNC
to factory default values) and follow the setup steps (they work, if
they are followed completely). The full set of instructions are found
at http://go.to/BEACONet (available after noon today due to a sheduled
power outage at the host site).

If the system *does* work on 144.39, then test your 10-meter transceiver
on voice. If still nothing conclusive, drop us back a note and we'll
help you through it.

Don't give up. :o)

Ev, W2EV

Hi Ev and the group. One test I made to be sure the system was working was
to temporarily connect 144.39 to the audio line of BEACONet. If packets
were printed, then the ten meter portion should work. It did! Cliff K7RR

Rendered body type: text/plain

Hi all. Just a short note (less of those long reports on activity
after nightfall here in the West!) to let you know K7RR is on PROPNet
transmitting Mins:32 time slot. The Southwestern stations usually try
to use 30 to 45 seconds after the hour. Transmissions at one minute
intervals started at 1630 UTC, Saturday morning. Cliff K7RR

Rendered body type: text/plain

I'm using PSKsrv with UI-View on 28.131, I have heard the following
stations so far.

2001-May-26 17:31 3 stations (Time UTC)

Callsign	Type	Latitude	Longitude	Km	Bearing	Last Heard
N1NCO	Grid Squ.	[FN42GL]		0.0	0	May 26 17:29
+PA3EUG*	Lighthouse	42.20.86N	071.08.36W	30.0	119	May 26 17:08
+WD4RBX*	Grid Squ.	[EM84NM]		1328.2	232	May 26 14:24

Is any one else on 28.131 today?

Hi,

I checked 2 meters aprs and am rx'ing loads of
stations there. I was rx on 10 until yesterday and I
can hear faintly a signal. Probagation at my qth is
bad at the moment.

I am switch to 6 meters for a couple of hours 17:18
EST

WA7GSK DN13 Boise, Idaho

I now have my Beaconet ststion up and running on 147.585 MHz. I am running
45 watts into a 6 db omni antenna. I will keep the station up on the air
through the e-skip season.

I am looking forward to seeing some action.

Al

Hey folks, here's what I'm hearing today:

2001-May-26 19:29 3 stations

```
Callsign    Type       Latitude   Longitude    Miles  Bearing  Last Heard
--------    ----       --------   ---------    -----  -------  ----------
+KC5DUI     Grid Squ.        [EM26WE]          720.1    236   May 26 13:44
+W2EV*      Grid Squ.        [FN03XD]          274.9     79   May 26 13:18
 N4ZQ       Grid Squ.        [EL88OA]          996.8    178   May 26 10:13

W2EV was heard via KC5DUI.  I was also hearing both KC5DUI and W2EV
yesterday May 25 around 1700, and again early this morning between 0200 and
0300 EDT.  In all cases, W2EV was heard via KC5DUI.

And I haven't seen N4ZQ before- welcome to BeacoNet!

Rich

Hi Joe,

Had a plot on you at 0141Z - your call was "garbled" (FRIU) but the grid square made it and have you on the screen. Shows 798km or 496mi to you.

Going to stay on PSK31 until the "predicted" storms move in for Memorial Day.

2001-May-26 21:49 5 stations

Callsign	Type	Latitude	Longitude	Km	Bearing	Last Heard UTC
+KC5DUI*	Grid Squ.	[EM26WE]		0.0	0	May 26 02:48
+WD4RBX*	Grid Squ.	[EM84NM]		1038.2	97	May 26 02:00
+FRIU*	Grid Squ.	[EM78FF]		798.0	71	May 26 01:41
+W2EV	Grid Squ.	[FN03XD]		1577.7	56	May 26 17:17
N4ZQ	Grid Squ.	[EL88OA]		1399.8	127	May 26 15:16

W2EV and N4ZQ were BEACONet on 28.128.

Bob - KC5DUI

That doesn't really count, does it now?

I mean, look at my current "best" digipeated catches on 144.390:

```
Callsign    Type       Latitude   Longitude    Miles  Bearing  Last Heard
--------    ----       --------   ---------    -----  -------  ----------
 KL5T-11*   No. Digi   61.06.06N  149.46.19W  3376.3    321   May 26 22:48
 KH2Z-9*    Circle (1) 34.02.12N  117.10.64W  2538.3    273   May 26 23:05
 KH2Z*      Red Cross  34.01.41N  117.09.45W  2537.6    272   May 26 22:08
 KM5HG*     Home       36.15.55N  095.42.18W  1376.1    260   May 26 23:06

(I didn't bother to send you the rest, about 100 more, all less than 1000
miles)

Hi Ramon,

According to the GR##ID the "DP" is me (KC5DUI).  I'm now trying some of
your advice and have changed my Beacon Text to read [EM26WE] DE KC5DUI
[EM26WE] - maybe it will get through better.  I think the more times PSKsrv
sees the DE CALL [GR##ID] the better chance we have of a valid plot.

Hope to see you on my screen soon.

Bob - KC5DUI - EM26WE

I am now setup and monitoring 10M and 6M. Is there any activity on either BEACONet31 or Propnet in Europe? I have received no signals on either band despite huge band openings on both bands last week. What frequencies should I be monitoring, and is there any activity on 20M or 30M? I will be monitoring 28.128 5/27 and 28 24 hours/day.

At 11:37 PM 5/26/01 -0400, Ramon Kolb blasted the following out into the ether:
>That doesn't really count, does it now?

      I only send what I find interesting.

      This morning, I'm seeing about 6 stations direct that I've never seen direct before. Must be some kind of local enhancement happening, but I haven't sent these. Usually I only send stations of 800 miles or more, as the normal range for our VHF network HERE is about 500 miles.

Is there any way to get UI-View or other software to draw a map
which would draw lines between the stations who receive each other??

It seems like comparing notes on who digipeats who doesn't make much
sense in terms of monitoring propogation -- unless we're looking
specifically at the all of "hops" along the way. If there was a way
to do this graphically, on a map, it make sense to me to look into it.

I'm still in rx only mode here, am waiting on some pieces parts from
Mouser to arrive via UPS so I can finish building an interface, but
have seen some interesting tidbits on and off based on things like
suddenly seeing /lots/ of APRS spots while listening to 144.39 one night.
I had started getting didipeats via K3NAL and another station. Discovering
what was going on took looking at the "effective digi path" section of
station details though -- and I eventually determined that all of what
I was seeing was coming through one of two digi's.

Anyhow, I guess my question is, does anyone know of a way to have
UI-View draw lines between the icons for stations on the map, such
that we could easily see propagation paths, as in which stations can
hear which others directly? A map similar to the maps that sometimes
appear in QST's "50mhz and up" column would be what I'm envisioning.

Hi Ron,

On 10m we're on 28.128 in FSK 1200 bps and on 28.131/+1500 (which is zero-beat around 28,132.5 kHz) in (B)PSK31. My PSK31 station is active 24/7, and I have free view into Europe at about 3 miles/5 km from Boston Harbor here. IF there are any conditions, you should be able to hear me. I've worked Europe in phone here on 10m quite a lot.

There is no activity on 20m or 30m that I know of, most has concentrated on 10m/6m/2m. I guess on 20m it would hardly be appropriate to set up yet another automatic station in such a crowded band.
You're the first one from Europe I heard of. Welcome to the club! Where in Belgium are you?

73s,

Ramon W1/PA3EUG, Boston MA [FN42KI]

Hi Dan,
I agree. This would be especially useful in high APRS traffic areas such as Arlington VA. Check out a UI-View plug-in called UI-Path at http://welcome.to/UIView. The cool thing about UI-View (one of many) is that it is written to allow ActiveX plug ins to be written. UI-Path is one of them.

However...I think that UI-Path requires the registered 32-bit version of UI-View (it may not work on version 2.x [16-bit]).

Check it out and let us know how it worked for you.

Rendered body type: text/plain

Hi all, I left WinAPRS on last night monitoring direct stations only and
was amazed to find the SE USA filled with stations on 144.39

The longest was KD4QIA-7 at 463 miles! And that was with my small beam
pointed at Tampa from Orlando - this would put KD4QIA-7 off the side of the
beam. Below are the two packets I logged from KD4QIA-7. Unless I missed
something this would make for the longest direct VHF I have seen so far.

KD4QIA-7>BEACON,KC4WCG-7,WIDE4*:!3328.40NN08649.95W#PHG5660/B'Ham Al.
KD4QIA@SCOTT.NET
KD4QIA-7>BEACON,WIDE4-1:!3328.40NN08649.95W#PHG5660/B'Ham Al. KD4QIA@SCOTT.NET

Screen shot of the SE USA at: http://psk31relay/vhf_ss1.html

Also on this page is a link to the raw history file (big 600k) , you can
run fun simulations!

Rendered body type: text/plain

I have moved up to 28.131 and PSK. After listening on 28.128 yesterday I decoded nothing all day even though I did HEAR signal from the speaker. For someone who spent 25 years flying around on C-130's, I have no hearing to speak off!! Therefore If I can hear the signal, then I suspect there is something wrong with the AGW Packet Engine. I do not believe this software is utilizing the sound card correctly. It seems the only signals it will decode are those that are greater than S5.

With the previous experiences I've had with PSK, great weak signal mode, I set things up for PSK and am now on 28.131. I have not totally abandoned 28.128. I have a DCD mod coming for my trusty ole' PK88 and will set that up with an HTX-100 later.

I will leave this up throughout the weekend to see what materializes.

I haven't even heard Rich since around midnight... conditions but be really bad. I hear N1NCO but that's a line of sight connection (18.7 miles).

Jeff and the net: This morning Sunday, N4GIL and W2EV coming in nicely in
Central California. Regarding the DCD mention below, I found that indeed
S5 signals are needed with the DCD but at least partial copy is obtained
when the ordinary threshold is adjusted properly. The DCD seems to work
fine on APRS and satellite signals but I find it a disadvantage on
PROPnet. 1200 baud just takes a large S/N ratio to work! Cliff K7RR

Not much today so far - except for N7YG, Good catch - it's clear across the
continent! I wonder if he heard/saw me? I'm also hearing W1/PA3EUG,(Ramon)
but he's only 30 Km away from me - almost line of site!

I think the + means that N7YG is using UI-View, not that I got him via a
digipeat. If it does mean "digipeat" then I must have got it from Ramon,
since he is the only other station I hear. In either case, it's pretty
interesting.

2001-May-27 16:56 3 stations (Time in UTC)

462. [propnet] Re: [Heard today on 28.131 - PSKsrv]

From: Ramon Kolb <ramon.kolb@usa.net>
Date: 27 May 2001 14:27:51 EDT
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-15072-2001.05.27-13.46.50--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Conditions are getting better on 10 meters:
My list:

2001-May-27 14:16 7 stations

Callsign	Type	Latitude	Longitude	Miles	Bearing	Last Heard
K7IP*	Grid Squ.	[CN87SW]		2491.3	297	May 27 14:16
N1NCO*	Grid Squ.	[FN42GL]		18.7	299	May 27 14:15
PA3EUG*	Grid Squ.	[FN42KI]		0.9	59	May 27 14:14
+N7YG*	Grid Squ.	[DM42NF]		2274.2	265	May 27 14:09
+RT4RBX*	Grid Squ.	[EM84NM]		833.2	233	May 27 00:06
+K4DMU*	Grid Squ.	[EM78FF]		809.8	254	May 26 20:41
DP*	Grid Squ.	[EM26WE]		1298.8	259	May 26 15:32

Now note that "*" means that it's heard via a digipeater (in this case, I'm
listening to PSK31Srv via the "internet" APRS port, which UI-View seems to
consider "digipeated". "+" means that it's a UI-View station using the
{UIV236} (or other ID depending on your version of UI-View) ID after your
beacon, and "-" would mean that it's a UI-View station that has checked "no
UI-View extensions" in the setup (ID is {UIV236N}).

--Ramon W1/PA3EUG multitasking: Beaconet^31ing and working from home right
now...

463. [propnet] Massachusetts Maps for UI-View on the web

From: Ramon Kolb <ramon.kolb@usa.net>
Date: 27 May 2001 14:37:22 EDT
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-15073-2001.05.27-13.56.18--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

For those that are interested: I grabbed some maps from the USGS Tiger website
and turned them into UI-View maps. I have the following:
* Massachusetts
* Eastern Mass.

```
* large-scale greater Boston (I-495 ring)
* normal-scale greater Boston (Rt. 128-ring)
* Boston (downtown to Braintree/Newton/Belmont/Medford/Revere)
* Downtown Boston - detailed with streets(Chelsea to Quincy, downtown to
Watertown)

(guess what... my QTH is in all of them :-) )

I've put it on the web at http://www.angelfire.com/ma/pa3eug/maps.zip .
The file is 899,112 bytes long.

>one of them.

      The way *I* do it is to run AGWPE, UI-View32, and WinAPRS, all on the
same machine at the same time.  If I want a UI-View32 function, I ALT-TAB
over to UI-View32.  If I want a WinAPRS map function, I ALT-TAB over to
WinAPRS.

W2EV and K4DMU coming in well, Cen Calif.
I'm convinced the TAPR DCD kit does not work well with PROPnet weak
signals. The print is far better using the ordinary threshold control.

John

Yes I was seeing you on the map along with Roman and a few others, up until
a few minutes ago. As I had the auto refresh turned on, Not sure what the
last time I head you. The + means I am using UI-View. I also saw a % land
station and a 4 land station since about 0700 Local time. Will keep this up
until Tuesday morning.

470. [propnet] DCD vs Threshold COntrol

From: "Jeff Steinkamp" <n7yg@arrl.net>
Date: Sun, 27 May 2001 14:38:16 -0700
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-15090-2001.05.27-16.57.01--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I would be interested in hear about others experiences with DCD and
Threshold control. My original post dealt with the trouble I was having
with AGW Packet Engine which is a sound card implementation of a packet TNC.
This software appears to use DCD. I have found that I can not copy any weak
signal with this setup. In fact It appears I need at least an S5 signal to
get reliable copy with the packet Engine. Not acceptable for weak signal
work. I have switched to PSK as this is an excellent mode for weak signal.
At this moment (2134Z) I am copying KC5DUI 100%. I have absolutely no
signal strength on the S meter and can just barely make out the audio via
the speaker, but the print on the PSK terminal and the display on the
waterfall is outstanding.

My future plan is to setup a beacon on 28.118 using my Rat Shake HTX-10 and
a PK-88. I thought about using the TAPR DCD modification so I can run
unsquelched, but from what I am reading this may be a problem also. Any
Ideas??

Hey, is it STILL April? Once again, I had to take my beacon off the air
due to thunderstorms. Well it's not entirely off the air. At the
moment,
it's running as a level one beacon on battery power. My transmitter's
output power remains at 50 watts. The KPC-3 is running from battery
backup, too.

Hi Al,
It's great to have you on-board from Boise!  Please be patient
(especially on 2-meters)  openings tend to be fairly narrow by nature.
It may take some time to see a success from your area of the country.

We've seen plenty of success on 10-meters, a few catches on 6-meters,
and one or two enhancements so far on 2-meters...but the season is quite
young yet.

A meteor shower is just around the corner, you may see an icon or two
for that.  More information coming, momentarily.
Ev, W2EV

welcome aboard!

Hi Ron,
There was considerable activity of BEACONet (ax.25 1200 baud packet on
28.128 USB) in Europe a month ago or so. You can see proof of that if
you visit the BEACONet website (http://go.to/BEACONet) and visit the
"Participation" hyperlink for some screen shots. Interestingly, I've
made eMail connection with Argentina -- where there is a station who has
been seen in North America...and is looking for some help in further
configuring their station. You may want to park on 28.128 USB for a
week or two to see what happens your way.

Not much known on BEACONet^31 (psk31 on 28.131 USB + 1500hz tone) from
europe at this time, but I'd expect a few joining us soon. Activity

there is growing quickly.

Welcome aboard! It's good to have you interested!

Warmly,
Ev Tupis, W2EV

Hi Rick,
You've got it right...28.128 USB. If you're using a KPC3+, then be sure
to follow the instructions on the BEACONet website
(http://go.to/BEACONet) for "Configuration | Level I" completely. They
will get your TNC configured to be the most sensitive possible. This is
the same system that I use, quite successfully.

As a test, you can dial-up the APRS frequency of 144.39. If everything
is setup correctly, then you should decode a bunch of traffic there.
Just be sure to come back to 28.128 USB. :o)

If you don't decode anything there...then go back and re-run the
configuration steps as outlined on the website. They absolutly work.

Welcome aboard!
Ev, W2EV

Referring to a band opening noted on the APRS network Dale said...

> Below are the two packets I logged from KD4QIA-7. Unless I missed
> something this would make for the longest direct VHF I have seen so far.
>
> KD4QIA-7>BEACON,KC4WCG-7,WIDE4*:!3328.40NN08649.95W#PHG5660/B'Ham Al.
> KD4QIA@SCOTT.NET

This is yet another example of why we *really* need to establish our own system of HUB-class stations. Dale's frame didn't come to him directly...they were digipeated through four other APRS digipeaters (well-placed stations at altitude with good power).

On 2-meters, this is especially important as these are the stations that can give us the best "heads up" to tropo conditions as they form. This isn't so important on 10-meters because the ionosphers is available to everyone. On 2-meters, the inversions (generally) favor stations at altitude first, then build to include the rest of the general population.

Please...if you have it in your power...establish a Hub-class station in your grid. Imaging each 4-character grid with one of these. The propagation network would be unbeatable!

Ev, W2EV
ps...thanks for the report, Dale!

BEACONet User Registration:

Ev and I have been working on a web page to allow us to take a "census" of BEACONet users. If you would like to be counted, please take a moment to complete the form, it takes about 1 minute. The link below will take you to a registration page. It will give you the option of registering for the Arietids Meteor Scatter event OR as a BEACONet participant. Complete the form for each band you will be operating on. So if you are out there and you actively participate in BEACONet, take a moment to be counted.

METEORegistry Registration:

About a half year ago I developed the METEORegistry web page to allow folks to register as participating in MS events. The purpose of registering is to provide a real-time list of participants to expedite communication and increase the chances of success. There are 9 questions, it should take about 1 minute to complete. The Arietids MS event is from May 22 to July 2 with a June 2 peak.

Click on the URL below and then click on Register Here link.
http://w9if.net/cgi-bin/beaconet/main.pl

Rendered body type: text/plain

Hello All,

Last week Ramon Kolb advised that he had prepared some UI-View maps for the Boston area.

I am working on a similar project for Southern California and can provide a small series of

UI-View maps (lat.lon corrected) looking north
and east from San Diego.

While there is a tremendous amount of 2 meter
APRS activity in the quad bounded by the Mexican
border to the south, the Pacific Ocean to the west,
Santa Barbara to the north
and the Arizona-New Mexico border to the east,
(at least 200 stations filling up the stations list today)
I am aware of only a couple of BEACONet stations
on the air at the moment.

Hopefully the availability
of some UI-View area focussed maps
and the fact that there are now two or three
full time 2 meter BEACONetters
in that "quad" will encourage more to get
in on the fun.

Regards,

Ed

Rendered body type: text/plain

The Arietids meteor shower is right around the corner, and a good
opportunity to put your high-power 2-meter BEACONet station through its
paces...even if you may not have "caught any BEACONet fish" yet.

The Arietids are known as "the daylight" shower because -- now, are you
ready for this(?) -- they occur when the sun is "up". :o) This is a
fairly rare event because it requires the earth to intersect the meteor
stream as it is receding from the sun (rather than approaching it).
There are other dynamics that make this an interesting event, but that's
a topic for another day.

Here are the specifics on the shower:

Name	Event Window	Peak	#/HR	km/sec
Arietids	May 22 to July 2	June 2	60	39

This shower is not exceptionally fast at 39 km/sec, so one wouldn't
expect a lot of dense ionization (not good for a 223-MHz attempt), but
it's probably do-able on 2-meters...especially with a 1 rock-per-minute
average rate.

What does it take to shoot the rocks with BEACONet? On 2-meters, you
will want to ramp-up for an ERP (RF out + net antenna gain) of 400 watts
or more. 100-watts to a 4-element beam should be about right to be
assured of a good chance of being heard by other stations. Of course,
lower powered stations can still participate...it's just that the

chances of being heard by others falls significantly as ERP drops below
400 watts.

It is important to register your intent to participate. This way,
others with beam antennas will know where to point them for maximum
results (there's no sense in beaming to a direction where there isn't
any activity, right?). Rich Parry (W9IF) has designed a site to do just
that. The direct URL is: http://w9if.net/cgi-bin/beaconet/main.pl but
if that's a bit intimidating, you can get there by typing:
http://go.to/METEORegistry as well.

Register for the Arietids, even if you don't have the 400 watts ERP.
Again, this will help others to know that you are active and may get
someone to point your way.

Full information on setup of your system for Meteor Mode is found on the
BEACONet website at: http://go.to/BEACONet | Configuration | Burst Mode.

Join in and see what you "catch". :o)

I've seen this before. Angelfire sometimes doesn't like it when you provide
links to a website. Try copying and pasting the URl directly into the browser,
that should work.

I just sent Dan N8YSZ some instructions on how to make your own maps using the
USGS/US Census bureau map server. Let me repeat them here so everybody can
take advantage of what's done with your taxpayer's money:

Go to this website: http://tiger.census.gov/cgi-bin/mapbrowse-tbl
-then create the map you want,
-download it,
-go back to the map on the website
-recenter it towards the upper left corner
-put a marker where the upper left corner of your downloaded map is
-scroll down and read the exact coordinates of your marker
-write these down
-do the same thing for the lower right corner of your map
-create a .inf file with the map name and coordinates
-you can use a graphics program (I use Adobe PhotoDeluxe, but any other
program would do) to "stretch" the map a little larger

calculation of the coordinates: for example: -71.12345 longitude becomes 71
degrees west with .1234x60=7.404 minutes. In the .inf file you note this as
71.07.40W

Good luck,

Ramon W1/PA3EUG

Hi folks,

Even though the METEOR website only gives me a "yellow" dot, I just wanted to
let you know that as of 10AM EDT (1400UTC), my 147,585 kHz BEACONet station is
in METEOR mode. To spare the relay in my amplifier, I'm in BURST mode between
for 15 seconds during the 1st 15 seconds of every minute. Just calibrated my
PC clock to WWV.

If this would cause interference to anyone else here in the northeast, please
let me know and we can set up a better transmission schedule.
I'm running 35W into a vertical at about 230ft ASL.

Rendered body type: text/plain

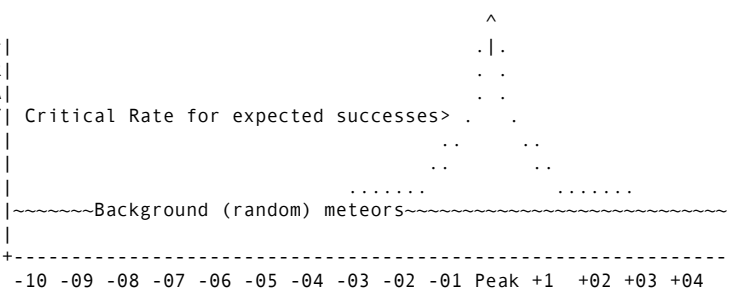
Hi everyone,
I should remember that we have so many newly interested folks, I need to
provide a little more information so we can be properly postured for

success.

When dealing with meteor showers, it is important to understand that the peak (plus and minus 24-hours) is what we shoot for ... as far as activity is concerned. The rough graph that I've included shows why:



So...why are meteor showers shown as taking place over a very broad timeperiod? Because that is when rocks *start* to come from the point in the sky that is associated with a given event...though the rates may be hardly distinguishable from normal background meteors.

The older the shower, the more broad the peak (there may even be multiple peaks, depending on which sub-stream the earth intersects in its travels). The grand-daddy of 'em all is the Perseids shower (in mid-August). It's been around so long that the ramp-up to the peak +/- 4-days or so will provide useful meteor returns for us.

So...if one were to target meteor mode operation, it is best to target +/- 24-hours from the expected peak. Doing so, we may even be able to document sub-streams of activity that may otherwise go unnoticed by our SSB/CW ping-jockey counterparts (because it's tough for them to operate 48-hours straight).

I will be ramping up for meteor mode on the evening of May 31st and will operate until the morning of June 3rd. 200-watts to a 4-element beam, pointing wherever activity on Rich Parry's METEORegistry map (http://go.to/METEORegistry) takes me.

Find that old, dusty 160-watt amplifier and get it hooked up!

Ev, W2EV

PS...yes...the above contains generalizations, but ones that are intended to get folks thinking about the natural cosmological event that BEACONet is made to observe. While corrections and clarifications are possible, let's not overload our newest BEACONet-ers with so much detail as to unnecessarily keep them from "thinking outside of the box".

Ramon!
What a great set of instructions! May I use them as a basis to put instructions right on the BEACONet website to help others in the months to come?

Either way...well done!
Ev, W2EV

of course....

By the way, Dan gave me a tip for a better mapping site. It uses the same
mapping engine, but you can specify the size of the map in pixels:
http://imap.chesapeake.net/cgi-bin/webmapper

If you want to publish this, just add a remark that they should use an
existing .inf file as template for the new map... and not to mess around with
the format of the coordinates. If you do something wrong in the .inf file, the
map simply won't show up in UI-View.

Hi Rich,

I just switched over to BEACONet^31 and watching the Terminal Screen I see
your call but haven't gotten a complete GR##ID yet. After reading a message
from Ramon (W1/PA3EUG), I've changed my format a little. In the Beacon
Preamble I have "BEACONET^31 DE" then in the BeaconText put in "[EM26WE] DE
KC5DUI [EM26WE]". When the system xmits I send:

BEACONET^31 DE
KC5DUI>APRS:[EM26WE] DE KC5DUI [EM26WE] {UIV32}^ED23

This should give PSKsrv two chances to see the DE and my call plus two
GR##ID. Would appreciate it if you could let me know if this is working.
>From what I can read the system is keying on the DE to catch the call and
then looks for [GR##ID] after that. Plus if I double-click on the call then
on the GR##ID it moves the data up to the send to client block and I can
send it to UI-View32 from a couple transmissions.

Would appreciate any comments.

Bob - KC5DUI - EM26WE

Hi all, I had WinAPRS set to display direct stations only and after
reviewing my APRS manual and looking over the history log file I saved I
believe I might have received one packet direct from 515 miles away!

I saw some more interesting APRS packets in the log - my understanding on
how to read them is if they have a * in them the station to the left was
the one it was received from and if there is no * it was received direct.

KD4PBS-3>APRS,WIDE3-2:=3540.58NN07832.15W#PHG5660/1200'AGL, wideN-N.
Comments to kd4pbs.dynip.com. 73!
(direct 515 miles)

WA4RWS-3>APRS,WIDE5-3:!3203.96NN08341.33W#PHG3364 Vienna, GA WIDEN-N DIGI
(direct 287 miles)

AB5WF>ID,KF4ZLK,KU4LY-7*,WIDE3-2:AB5WF/R 5WF-1/B
(received from ku4ly-7 350 miles)

KD4MOJ-5>BEACON,KF4ZLK*,WIDE:KD4MOJ-5 Quincy Florida APRS Digi -
kd4moj@kd4moj.org
(received from kf4zlk 465 miles)

W4AP-8>APRS,W4AP-7*,WIDE5-2:Montgomery AL W4AP MARC DIGI (kb4jhu@arrl.net)
(received from w4ap-7 397 miles)

Maybe I'm wrong about how to read the packets but it was interesting and it
sure sounded like VHF was wide open - there was continues packets coming in
with no letup - I wonder how many packet collisions there were and how many
long range packets that did not copy because of the collisions.

Anyway I put a screen shot up at: http://psk31relay.net/vhf_ss1.html

And a link to zipped raw logs if anybody wants to check them out.

To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-15270-2001.05.28-17.18.03--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all

I have been playing with UI-path and BEACOnet^31 today. I am finding the
information from UI-Path to be very interesting. For example, My beacon TXed
15 times and I. RXed KC5DUI beacon 10 times (actual report). Also UI-Path
tells me that I have received him direct. It will also draw a line from your
station through the path the signal took to get to you on your UI-View map.
At this time I am not use this feature. I would like one modification to this
program. I think what needs to be add is a first heard time with a laps time
counter (so he will be relisted) so I would know that I have Rxed him in the
AM then a gap and again in the PM. Ya I know, Run a log file.

Ev - Do I see a possible database here? It would be helpful to have list,
by band and tx type (AX25 vs PSK31 where both are in use) with grid or other
location data. (Might put in a relatively short expiration date so info
doesn't get old - i.e. have to "re-up" periodically.)

Rendered body type: text/plain

A warm round of thanks to Rich Parry (W9IF) for not only establishing
the METEORegistry page (http://go.to/METEORegistry) but creating a
section that Standard Mode folks can use to "register" their stations.

Using this resource, we can get a snapshot of who is active, and where
they are. We can tell at a moment's glance if a new participant should
be hearing local activity or not (under normal conditions).

You may want to print this out, and use it as a check-list...

Here's what you do to register (even if you are not active 24/7):
* http://go.to/METEORegistry
* Hyperlink: Register Here
* Drop-box titled "Choose one"
  - Select "BEACONet 06/01" ((we'll do this every month or so,
                                just to keep a finger on the pulse
                                on the project progress))
* Fill out the rest of the form
* Use Optional Comments as follows:
  - Standard/Intermittant, Configuration Code, BEACONet/BEACONet^31
    . Standard = 24/7 operation while Intermittant = what it sounds
      like
    . Configuration Code will help to guide what we can expect from
      your station
  - Examples of Optional Comments:

. Standard,HY1G02-15,BEACONet
. Intermittant,HY0F01-15,BEACONet^31
. Intermittant,VK1E22-7,BEACONet

I will use this information when I write a recap of this spring / summer / fall activity for QST. Please be accurate. *DO NOT REGISTER IF YOU ARE A LURKER* Register only if you are a TRANSMITTING participant, please.

Had excellent copy on WD4RBX from 1803-2308Z 28 May 2001. During the five hours had about 36 plots on him according to the Log File. Received one plot on K9ER at 0045Z 29 May - had a few errors in the print but was able to double-click on the text and send it to UI-View32 so it could plot. Unless I've got something set wrong, when working with PSKsrv the Log File doesn't show a user readable time. Used Log File Extract to pull the calls from the file.

Looks like we'll be having storms from late this evening until Thursday or Friday (subject to forecaster error) so will be shutting down the system when I head for bed tonight.

I've just changed my 2m APRS station over to BeacoNet mode tonite.

I'm running 45w into jpole at 30'AGL (430'ASL) using KPC-3 v8.3

Wish I had it set up for BeacoNet this morning. We had a band opening here to the SE between 14z & 15z.

Ev, is there an upcoming MS event any time in the near future?

Rendered body type: text/plain

Hi Folks,

Just a quick update on registration.

- o BEACONet Census: 19 users on ALL bands.
- o Arietids MS Event: 8 users on ALL bands.

==========

BEACONet User Registration:

Ev and I have been working on a web page to allow us to take a "census" of
BEACONet users. If you would like to be counted, please take a moment to
complete the form, it takes about 1 minute. The link below will take you to
a registration page. It will give you the option of registering for the
Arietids Meteor Scatter event OR as a BEACONet participant. Complete the
form for each band you will be operating on. So if you are out there and
you actively participate in BEACONet, take a moment to be counted.

METEORegistry Registration:

About a half year ago I developed the METEORegistry web page to allow folks
to register as participating in MS events. The purpose of registering is to
provide a real-time list of participants to expedite communication and
increase the chances of success. There are 9 questions, it should take
about 1 minute to complete. The Arietids MS event is from May 22 to July 2
with a June 2 peak.

Click on the URL below and then click on Register Here link.
http://w9if.net/cgi-bin/beaconet/main.pl

Hi Chris,
CD SOFTWARE is a command that is specific to the Kantronics TNC's. It
allows open squelch operation and the subsequent <sp?> ability to decode
weaker signals.

> EN80mc

Of course, there are many reasons for not receiving much, especially on
VHF. The APRS community is about 8-years ahead of us in establishing
digipeaters at altitude. I'm coming to the realization that -- at VHF
-- this is an important component to the long-term success of the
BEACONet system.

It is the Hub-class station that will experience long-haul openings
before other participants will. So...I'll use this as another
opportunity to plead for the establishment of Hub-class stations
wherever possible. See the BEACONet web site (http://go.to/BEACONet |
Introduction | The Lingo -as well as- Configuration | Hub) for more
information.

Don't give up for lack of reports on VHF. The concept is sound (as is
demonstrated daily on 10-meters), it's just a matter of time and
participation density on 2-meters. In the mean time, get ramping up for
meteor mode. :o)

Warmly,
Ev, W2EV

Rendered body type: text/plain

Hi Steve,
Welcome aboard! You will find that the digipeating infrastructure of
BEACONet pales in comparison to what you'll find on the APRS frequency.
Even though BEACONet's HOPn-N digipeating system is vastly superrior to
APRS' RELAY,WIDE,etc system, we are finding that our lack of Digipeaters
at altitude (we call them Peer-Hub's and Client-Hub's) causes us to miss
openings that are probably occuring.

It's just a matter of time to see if we can get enough
propagation-tracking interest to get some Hubs established. In the mean

time, stick with us. BEACONet is alot like fishing...you can spend a
loooong time without any results, then get rewarded with "the big
opening" (a fact that the 10-meter participants have come to realize on
a weekly basis).

It's good to have you active, for sure!

Yes...by the way...the last meteor shower until the Perseids is coming
up with a peak on June 2nd...the Aurietids. See
http://go.to/METEORegistry for "signing up" and http://go.to/BEACONet
for setting up. :o)

Warmly,
Ev, W2EV

I have brought my station back up on 28.128 and setup for Meteor mode. Will
try and leave this up for 24/7 for the next few days and see what happens.
I'm still using the AGW Packet Engine. Not sure where the DCD mod from TAPR
is. Was shipped last week -- maybe via Hong Kong.

Looks like you received my beacon--- though a little garbled.

For the rest, I received NO signals whatsoever today. The last one was Rich
WD4RBX just after midnight... what a day!
Furthermore, I installed a new 2 meters antenna today, a vertical with a
whopping 3.4 dB gain :-). Since they don't tell me if that's dBi or dBd, I
have to assume it's dBi and therefore just a little better than your average
dipole :-). Signals seem to have gotten stronger though, but I still have to
tune to antenna to a good SWR on 147585.

Jeff and the group. You mentioned obtaining a DCD kit from TAPR. My PK
232 has had one for some time. I put this on 28.128 and found that S5
signals were required to activate it. Eventually, I went to another unit
without DCD using the threshold control carefully, found much better
operation. Yes, PASSALL ON does help. Cliff K7RR

Wayne,

You need to switch Autocapture on and "check CRC" off in PSK31Srv. I
remember having the 1st and the 3rd option in the "options" menu switch on,
and the "check CRC" is in the "setup" menu. The problem with CRC checking
is, that it also checks the preamble that you configure in PSK31Srv, and
most time you don't receive that one completely due to the few seconds
needed to tune in "scanning" mode. Sorry that I can't tell you exactly where
these options are, but I'm at work and I don't have the software installed
on the computer I'm on now...

Now, when everything is captured well, you should be able to see an entry
appear in the "monitor" area of UIView. Entries should appear both for SEND
text and RECEIVED text.

If you don't see anything, you should do a Start -> Run and type "telnet
localhost 3131". That should show a telnet window that allows you to monitor
what's communicated from PSK31Srv to UIView.

I may be able to help you more, but not until I get home tonight. Where are
you located?

We could be doing this today, if it weren't for pushing the questionably
useful proximity tracking feature. WIDENs are recommended to have the
UIFLOOD parameter set to NOID to enable proximity tracking, which
effectively makes them 'stealth'. If the parameter is set to ID instead,
we could easily detect when a mountaintop WIDEN on APRS is being directly
heard as a result of an opening.

541. [propnet] New AGWPE version released

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Wed, 30 May 2001 17:03:11 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-15675-2001.05.30-16.24.13--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

FYI...
Ev, W2EV

For those of you interested in using your Windows-based APRS programs
with a sound card and AGWPE instead of a TNC

AGWPE Version 2001.16 is now available at
http://www.raag.org/sv2agw/agwpe.zip

The improvements in this version are listed below. In particular, users
will appreciate some fixes for Win95 use and for running two sound cards
at once. George, SV2AGW, says on his web site:

"AGW Packet Engine enters the Millenium with this version!!! Tried to
fix most of the problems. Now every new version has an introductory
dialog, with all the fixes and updates.
Fixed the problem with multi sound cards on TX.
Fixed the problem with the security validation.
Added new functionality to AX25 protocol, to fix some problems with BPQ
nodes.
New Driver for G4XYW modem.
Still no hf 300b modem for the Sound Card.
No fix for the USCC and OptoSCC driver yet.The problem is that currently
i cannot find such cards here."

You can find out more about running with AGWPE (and no TNC) at:

http://www.qsl.net/soundcardpacket/

Going to SeaPac Doug?   Two six-packs and we should be
able to solve it once and for all...   Until the next
morning.

>If the parameter is set to ID instead,
> we could easily detect when a mountaintop WIDEN on APRS is
> being directly
> heard as a result of an opening.

There should be some way to get the best of both worlds.
A tweak to the existing configuration or "standard" beacon
scheme.

The real issue that I'm suggesting is we need a mechanism
to record packets from openings.   An "I heard K7IP" message
to the sig is interesting but essentially the data is
lost and gone forever.

So I got the bright idea that this could be automated.
A sound card program should work. Good thing I checked
before asking about it:

  http://www.ncdxf.org/beacon/beaconAutomated.htm

This HF data - added to Propnet VHF data - would make
for some fascinating research.

Bill - WA7NWP

PS. Are we working to share data with the High Speed (CW)
Meteor Scatter folks?

Hi Ramon,
I still can't get the stations to print on the map. I
am now copying you on psk solid copy so thats a good
start. I can telnet to the local port and see
everyhting coming in but not to the map still. Any
ideas? I am using the the uiview 16 and not the
registered one by the way.

thanks

Hi Ramon. Just started printing you at 01:24Z. Missed you at 01:29Z, but
caught 01:36Z. At 01:42Z, I changed over to the elevated vertical and
gained an S unit to S2. Transmitted a reply to you indicating both hori
and vert polarizations. I have been transmitting 15 Hertz lower than you,
but no concern now as I am right on your freq now. Cliff K7RR (CM95ni)

Rendered body type: text/plain

Hi Folks,
I've still not been successful in getting PSK31srv and UI-View16 working
together...so I had to ask the author about clarifying a couple of
points. The first was if the CRC included the preamble...the second was
a suggestion that PSK31srv decode everything in the window, rather than
scan...to allow "instant" decoding, without the need for a preamble.
You can see his responses below.

Ev, W2EV

Hi Bill (and group),
WIDEn-N is an APRS issue. On BEACONet, we use HOPn-N, which is TRACEn-N
by a different name. It does everything that you describe is
"needed"...providing full tracability of a propagation path. WIDEn-N
will not ever, with only one exception, provide enough information to be
usefull to propagation tracking enthusiasts. The only exception is
WIDE1-1.

> The real issue that I'm suggesting is we need a mechanism
> to record packets from openings.   An "I heard K7IP" message
> to the sig is interesting but essentially the data is
> lost and gone forever.

This is an important and insightful statement. It is actually part of
the BEACONet vision (just waiting for someone with the programing how-to
to implement). Check out the BEACONet web site at http://go.to/BEACONet
| Introduction | The Lingo. Scan to the bottom and read all about
"DATArchive". I'm working on the first part of that vision right now
(it's on the website under the hyperlinks of: Participation | Successes
| DATArchive), and am getting close to making it happen...the ability to
upload Station-heard lists from UI-View to a database. My programming
skills will need to be enhanced before I can even hope to come close to
comleting the DATArchive vision.

So...Doug's on the right path. It's just a matter of finding a way to
get there for real.

Ev, W2EV

Rendered body type: text/plain

Here's a question for those active on 10m BEACONet.

The other day while attempting to sort things out with LU3AVO it ocurred to me that it would be nice to have another station active in that part of the world. Further, I had a feeling that I could probably talk my friend LU6KK into activating his station on an equipment available basis. I ran the idea by him and he said that not only could he get on, but that lately the equipment is be available during most of the day. My question for those currently operational on 10 is: WHere would this new station be most useful, on 28.128 or running PSK31 on 28.131? It looks like it might be easier for him to tool up for PSK31, but either mode is a possibility. Any suggestions?

73, Scott

About the 30 Hz low... I "calibrated" my signal zero-beat on Doug's last
weekend... resulting in an actual TX offset of 1475 Hz instead of 1500.
Actually, that was a "compromise" between Doug and N1NCO... I *know* that
28.131 on my TRX is not exactly that, that's why I tried to adjust to other
people's signals.

Cliff, what is your frequency counter setup? Do you actually measure the RF
signal at 28,132.47 kHz or are you measuring the AF frequency of 1470 Hz
(which is subject to inaccuracies in your receiver frequency)?

Hi all. Good post Ramon. I was fairly sure that you were
doing a "compromise" as I could see that frequency was moving
slightly each time I printed you in reply. Finally I found
that the AFC in DIGIPAN was shifting to what was received but
no accurately enough for weak signals. I was using a counter
placed on the transmitter. It was reading 28 MHz signals
directly. PSK31 works so well I do hope we can find a way to
stay on frequency and take advantage of it. Cliff K7RR

Rick, glad to know your using DIGIPAN as well. At least it
is a good start until the more complex programs can be gotten
going. There is a scan feature there which I've not used as
yet. Somewhere there has to be a way of making the program
BEACON at intervals. Cliff K7RR

Hi Bob I have the same problem. Ruth and I plan to try to keep the 147.585
beacon running between storms today.

BEACOnet^31 was a 2 hour event for me. This is what I cough.

PA3EUG = 1466
K7IP (no plot on UI-View) = 1352
KC7DUI = 1317

after the = is the audio freq.
Rich

Ev

Had to shutdown as I was getting into one of the TV channels (PBS) a bit. I
will bring the meteor mode up this evening when I get home from work (0100Z)
and let it punch out burst over the weekend. Think I will throttle back to
about 25 watts and see what happens.

Jeff N7YG

Hi Rick and the group. First, YES we are all low in frequency a bit, but
we will get it soon enough. PSK31 is proving to be very sucessful for me.
This morning Ev was loud and clear starting at 1500Z. You are fading out
now at 1750Z. Doug, K7IP time for you to come out of the noise! Cliff K7RR

Hey cool! I was in Meteor Mode yesterday starting around 1800 EDT, looks
like I hit one of those Arietids rocks and you picked me up, Rick.

I'm running 180w to a 4-el quad, pointed 5 o'clock right at you.

73,

Rich

Hi Rich and Bob

I am glad that the thunder storms let up long enough so I could play on
BEACOnet. I ma sad to say that I have to shut again down tonight. I really
enjoyed chatting with both of you.

Rich, 17 watts will tell you a lot about the band. I have been running 25
watts on BEACOnet and have enjoyed great success. Keep your beacon rocking !!

Bob, You are lucky! I had a plan that Would have your message screen full. I
was going to ask Rich to send you a boat load of messages and I was going to
do the same. The thing that saved you was the band fell out. LOL

You can have fun with selective band openings without making a mess of the
band.

 O YA! My kiss mode kept carping out.

Rich

Earl - Oooops - should have said times were local - Central Daylight,
about   Will step beacon time up later tonight for 3-4 minutes and up
power to ~100W (tears the SSB rig sitting next to it to pieces!). BTW -
ballpark distances were 800 to right at 1000 miles (center of grid to
center of grid) Which I could setup Level 2 but the old TNC2 wont
hackit with KISS.

Bruce, KD5IUG

At 09:06 PM 6/1/01 -0500, Bruce Brackin blasted the following out into the
ether:
>OK Earl - since I know how to set beacon text, UN and beacon time and
>that is about it, would you tell me what the WIDE5 and WA5IHK call is
>about. (nutshell version OK!!) - Bruce

      Awww!!!!!! You aren't going to believe this!

      I run a cross-band digi using UI-View32! The other two stations were
heard here via regular 144.39 packet, and the digi I heard them through is
-- WA5IHL-11!

      Just ask Ev how well that particular digi has served me in the
past... <G>

      7 3
      Earl

Congrats Bruce! It looks like the "fish are biting"! :o)

Quick point of clarification, though...

```
> K5MJE-1>APS199,WA5IHL-11*,WIDE5-1 [06/01/01  10:05:45]:
                ^^^^^^^^^^
                         |
                         This was the station that you "heard"
                         it from, not KD5XB

> KD5XB-2>APW251,HOP1-1 [06/01/01  10:05:51]:
  ^^^^^^^
  You heard Earl, direct

> WB5LJO>BEACON,WA5IHL-11,WIDE5* [06/01/01  10:06:27]:
                ^^^^^^^^^^^^^^^^
                You heard it from WAIHL again, but after it had
                bounced around the network one more time.

My gut tells me that Earl has a cross-application digipeater running.
We call them BRIDGE's (since that is the computer-network definition of
the function...for some reason unknown to me, the APRS crowd calls 'em
GATE's).

Still...this is nothing to sneeze at.  Great catch!  See Earl, there
*is* propagation to New Mexico! :o))

Bruce,
Describe for me your setup, would you?  I run a 100 watt HUB on 53.530
and experience absolutly no self QRM to my FT-920.  I'm curious as to
what you use on SSB, and wonder if maybe your BEACONet system is either
over-deviating (over driven) or if you could progressively back down
your power until you no longer have problems (and note at what level
that happens).

We play on 53.53 *because* it has the least chance of self QRM of any
amateur band.  Now you have my interest piqued.

Just got up, & don't have time to write about all of it, but there's
a pretty good local enhancement underway out here. I can see stations
DIRECT from as far as about 450 miles!

      Two examples are N5XTH in northeast Oklahoma (450 miles) and WX5II
near Blanco, Texas, at 412 miles. Also have N5LTC-4 and N5WRW-1, both in
Del Rio, Texas, at 375 miles. All direct on 144.39!

Rendered body type: text/plain

Ev - main problem is physical distance (or lack of) between beam and vertical. After tree comes down (hopefully today) the beam will go up and wont be 'looking' into middle of vertical. Vertical is on chimney mount and beam on HD pushup only 12-15 feet away. When last two sections of mast are pushed up and guyed, the top of the vertical will then be 10-12 feet below beam (15' boom) and that should help. They have to be cross reacting with each other right now. Running a old but good Swan 250 for SSB and Standard 5900 tribander for FM, with or without amp for 6m (100 watt) or 2m (about 70 watt). These sets 'live' about 2 feet apart.

>Was able to exchange messages with WD4RBX and read his traffic to N8QLT.

Bob/Rick and everyone else,

This was an interesting opening last night. Around 2003 EDT I was downstairs and heard a really loud packet come through in the shack upstairs. It was LU3AVO blasting in. About 5 minutes later LU3AVO dropped out and I was hearing two packets in sequence, one a little lower in frequency from my VFO, one slightly higher.

I tuned down and caught Bob, KC5DUI digipeating WD4RBX. Tuning slightly higher I caught WD4RBX direct. After about 5 more minutes of trying, I successfully queried WD4RBX's station.

I also caught N1HVH once and tried to send a message, but didn't get through. Anyway, Rick and I were able to carry on a QSO from about 2014 to 2053 EDT very realiably, with good ACKs. The reason I dropped off KC5DUI's screen was probably becasue I tuned up frequency to center on Rick's signal. The band opened and shut in less than an hour.

BeacoNet is a blast for discovering these brief but excellent openings. I have UI-View on 10m set to ignore my own station, and set to announce received stations on every packet. This way I can be around the house and when the band opens I hear the callsign announcement alerting me to the band opening.

Fun stuff,

Rich

Thunderstorms are gone for the moment so am back up on 28.128. Forecast has storms again tonight and then sporadically through Wednesday.

Can hear some weak packets at the moment (1600Z) but nothing printing yet. I'm trying a new interface to the soundcard (Tigertronics SignaLink) that doesn't use a serial port to key the rig so would appreciate knowing if anyone copies my signal today. May try BEACONet^31 later.

29. [propnet] no DX on 28.131 PSK this afternoon?

From: "Ramon F. Kolb" <ramon@ieee.org>
Date: Sat, 2 Jun 2001 16:35:01 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-16322-2001.06.02-16.00.17--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The only one I've been hearing all afternoon. is N1NCO...

Have we given up on BEACONet^31? Seems after a few weekends, activity is getting less and less and less...

Let me re-iterate the advantages of PSK31 over packet:

- a LOT lower signal required for (near-)perfect copy. You'll have a better overview of conditions, as signals don't need to be booming in order to be received
- a LOT less equiment needed. A PC with a soundcard is enough to decode us. For real low-key reception-only stations, placing your PC microphone close to the TRX speaker is sufficient for 99% copy
- A LOT better use of bandwidth. PSK31 signals are 65 Hz wide, while AFSK signals get close to 3 kHz. That's almost a factor 5 !!! (This feeds into the first argument about signal levels)
- If combined with a CW ID, also non-PSK31 stations can easily identify stations on frequency and therefore know about conditions. Most CW stations are willing to listen for a few seconds to a "bare" carrier-like signal as PSK31 is, but are not willing to listen to packet signals.
- PSK31 has no requirement for 100% copy and the source coding scheme has an error correction algorithm built in. Packet radio requires all bits to be received perfectly, the signal is relatively hard to tune in into, and although the source code contains error DETECTION elements, it doesn't do any error CORRECTION.
- Running 30 Watts PSK31 will save you 30% in electricity compared to a 100 Watts packet signal. (OK... I know... fuzzy math....) Especially important for those that live in California.... :-)

Do we need any more arguments? When will I copy you again? It would be good if we could set up a network with regular and consistent presence among the operator, so "I don't hear AA0XX" means "there are no conditions to AA0XX"...

Hope to see you soon!

-Ramon W1/PA3EUG

Rendered body type: text/plain

I agree with Ramon.
I just moved to 28.128 packet about an hour ago because there did not seem to be any activity, other than the regular "cross town" PSKsrv "QSO" with Ramon. I moved the rx down to 28.128 a few times, just to see what was going on there and heard lots of packet. This means that there just are not any stations on 28.131 at the moment, but the band is fairly active.

It's unfortunate in some ways that most of us have to make a choice - either 28.128 packet or 28.131 PSK. I've even thought of writing a program to get my radio to spend equal amounts of time on each frequency via the CAT control port.
The "standard" at the moment seems to be 28.128 packet. PSKsrv has the potential to do even better, but we need many people in different parts of the country/world to really figure out how to make it work.

When we first started with PSKsrv, we had both PSK and 1200 baud packet on 28.128.
At one point I had both my KAM and PSKsrv running and hooked up to the tranciever. I was copying stations from both of them. The main problem was

that much of the time both signals came together and stamped on each
other.
I had some simple logic that gave the KAM priority on the PTT line.

Maybe if we had some kind of time slot coordination - say 1200 baud packet
followed by pre determined gap, which could be filled with PSK, we could do
both at the same time. Needs a bit of thinking through, but I'm sure you
get the idea.

I'm currently seeing:

K4DMU, and N8QLT on 28.128

No way is PSK31 dead! There is a great reason to use the weak signal
capability of PSK31 but we have a real problem, one that amateurs are
well equipped to solve: Frequency accuracy and stability. All we need to
do is be on the same frequency!
     No signals today, Saturday. I've been beaconing on Ramon's frequency
when I last heard him. K7IP has been busy on 28128.
     Remember that we must hit 28132.5 (1500 Hz tone) within +/- five hertz
to be effective. The transceiver dial is not that good nor is the crystals
in the sound card, so I would recommend the use of an external counter to
get us all on 28131.000 +/- a few Hertz. PSK31 works so well! Cliff K7RR

Hi Cliff and all others,

I'm not sure I agree to the frequency stability argument. If you use PSK31Srv (and this is a lot better equipped to interface with UIView or any other tracking program), a frequency acuracy of +/- 100 Hz is enough, because of its built-in scanner. We _won't_ be all on the same frequency... that's Utopia. I don't have a crystal tuned transceiver, and I would guess none of us has. Further, 5 Hz stability over a long time period and wide temperature range would be difficult for all transceivers.

So, if you use PSK31Srv with its scanning capability, tuning will work within about +/- 100 Hz of the center frequency. If you set up your scanning width any wider, your "hit rate" goes down because the audio spectrum sometimes contains stronger peaks than the signal it is to tune to. The length of the preamble string is also of importance, if this string is longer, then the PSK31Srv scanner has more time to tune in to the signal. A string of about 20 characters has been proven to work for me for almost all cases, and anything over 10 characters seems to work reasonably well.

Ev asked me to do a writeup of these factors. Right now (read: most of yesterday and today) I've been working on a (long) system level requirements document for my QRL. When I finish this, I'll put a little whitepaper together on BEACONet^31, what's needed, how to set it up, how it works, etc. After all you experts out there review it and comment on it, Ev can publish that at the website if needed.

Heard today in BEACONet^31 on 28,132.5 kHz:
N1NCO (18 miles distance)
N9ER in EL06UF, at 1,895 miles distance (last heard at 19:30 EDT)

73,

Ramon W1/PA3EUG

Have been on 28.131 most of the afternoon and currently have K9ER on the map
(last heard 0023Z 03 June). Looking through the PSK31Srv screen I can see a
couple partials on W1/PA3EUG but don't have a complete GR##ID on him. I
have my TX freq set on 1500, RX on 1500 with Scan checked and TX=RX NOT
checked. I know that rigs are not completely accurate but with the Scan set
at 100Hz (+/-) hopefully I'll pull in some of the signals in the general
area. Anybody found any benefits to using a wider scan range?

Bob - KC5DUI - EM26WE

Hi Ramon,

Went I sent my last message this one was retrieved and you answered my
question about the wider scan range. Boy that was a quick response!! Have
you tried changing the scan step from the the default 50Hz? Was wondering
what 20 or 25Hz would do to the possibility of getting a quicker lock on?

You show on the PSK31Srv screen a couple times but each time the GR##ID
wasn't complete - one time the "[" at the beginning was showing as a ")" so
it didn't plot and a double-click doesn't seem to recognize it. I seem to
have lost K9ER about an hour (1930CDT) after you but not sure when the first
plot was. Forgot to start a log file so can't replay the afternoon's
events!

Did you (or anyone else) see anything from me? I'm just started using a
Tigertronices SignaLink as an interface to the soundcard since it doesn't
need a serial port and know the receive works but not sure how smooth the
xmit is.

Bob - KC5DUI - EM26WE

P.S. Just received another plot on K9ER at 0058Z!!

Bob,

thanks on the partial copy :-)

IMHO 100 Hz scan width is about what you need to do. I'm not sure about your QTH and local noise level, but in my situation (urban Boston) the noise level is too high to increase the scan width over 100 Hz, since then all incidental noise peaks are also locked in on... This can have as effect that while the program is locked on, it misses the actual signal.

Another observation I made (but I haven't really been able to test this) is that while you're locked on and receiving, your transmitter isn't keyed if a beacon is to be sent. Is this true???

73s,

Ramon

Ramon,

>From what I've just observed (was watching the PSK31Srv screen) my rig keys up when it's time to xmit regardless of what is happening. Was copying K9ER and my rig jumped in with it's beacon. What I did notice was that I sent a message to K9ER via the PSK31Srv screen that must have been xmitting when UI-View32 reached the time to send a beacon - that beacon wasn't sent at the time but was sent out when the next beacon triggered - two beacon messages for the price of one!

I really like the feature of being able to double-click on a call and then on the GR##ID and send it to UI-View. Of course, you have to be monitoring PSK31Srv to catch it on time but helps show what is happening. I'm still sending a DE at the end of the Preamble Text so it "relates" to my call then in the Beacon Text have GR##ID followed by another DE, my call and the GR##ID again. Hope this helps out for better copy.

Still watching for you on the map but haven't even seen any partials.

Bob

Hi All

I tried something that I did ounce before but today I found out something I
did not know. I am running BEACOnet and BEACOnet^31 at the same time. Yes, it
does work! Not only does it work but I snagged KD4DMU on BEACOnet (check the
Km) and sent out his beacon on BEACOnet^31. The same thing happened with
LU7DAC. I am not hearing any stations on BEACOnet^31 so for now I feel my
playing around in this configuration is harmless.

Ev, I am wondering if My catching KD4DMU is a new short distance record for
BEACOnet?

Rich

43. [propnet] east coast enhancement on 2 meters

From: Stan Horzepa <stanzepa@mail2.nai.net>
Date: Sun, 03 Jun 2001 11:24:03 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-16446-2001.06.03-10.44.43--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

There was a slight enhancement of propagation on 2 meters overnight along
the Northeast Corridor. My APRS digi copied stations from New Hampshire to
Maryland with the best catch being K3ATI in Northeast Maryland 205 miles
away.

I hope you all don't mind my 2-meter PropNet reports from the APRS network
on 144.39, but since I run a full-time APRS digi that a lot of stations
depend on, I am reluctant to switch over to the PropNet channel on a regular
basis.

Earl -

KB5HAV-2>APW251,AB5WF,WIDE3*:}N4BSA>APW251,TCPIP,KB5HAV-2*:=2753.01N/08247.8

3W_PHG7180/n4bsa@arrl.net - Pinell <LINE TRUNCATED>

the KB5HAV is Bobby and AB5WF is Ron here in Jackson area. This is, I
beleive, from our club digi - 100w on top of stadium lights about
300-400 yards from my work. Guessing, but the antenna is probably close
to 200 feet above ground and the stadium is built on hill with good
western view

I had the 2m beacon going last night.

Bruce

Just a question about the "WIDE" method of digipeating. Is there any way to
figure out WHO the digipeater is? Or can that only be done when using TRACE
digipeating?

Anyways, the WIDE digipeater could be next door from you, like here in
Boston. I think my situation for VHF is pretty bad, but the digipeater net
on the APRS frequency is great, and I normally hear stations up to 2000
miles distance from here. That's more a measure of the quality of the
network, not that much a measure of VHF conditions at any time.

Therefore it would be good if we could track the exact path taken. I saw
some utilities for that on the UIView website, but I haven't had the time to
check them out. Anyone any experiences?

At 07:02 PM 6/3/01 -0400, Ramon F. Kolb blasted the following out into the ether:
>Just a question about the "WIDE" method of digipeating. Is there any way to
>figure out WHO the digipeater is? Or can that only be done when using TRACE
>digipeating?

Unfortunately, with a packet like shown below, the information just isn't there. TRACEn-N is the only way to do this on 144.39, and it becomes problematic at best, as the packet gets longer and longer as it progresses down the path. At some point, it becomes so long that the next digi doesn't repeat it.

You're right. If I remember correctly from the times I was a real AX.25
expert (somewhere in the beginning of the 1990's :-)) the max. number of
digipeaters that you can fit in the AX.25 field is 8 or so. But we should
"invent" something where you "recycle" (i.e., shift left everytime you pass
a digipeater) the digi field. That way you can see at least who the LAST
so-many digis were...

Any volunteers? :-)

Hi Ramon

You bet! BEACOnet^31 needs work (experimentation) and I am glad to help. I am
not a tecnowiz but I can put a beacon on the air. I am looking forward to
reading your BEACOnet^31 set up. I would like your opinion on my "Check this
out" post earlier today.

Have a super day

Hmmm. I'll bet that's supposed to be "N8QLT", looks like my packet might have gotten a little messed up.

However, this is still pretty cool if my station has been received via the Arietids on both 2m and 10m.
Unfortunately I haven't heard a thing on either band from rock bounce from anyone.

Rendered body type: text/plain

The Meteor Scatter and Beacon Registration Web Pages has be open for a week
now. Thought I would give folks the current count.
    * Active BEACONet users = 25 (seems a little low given the activity on
this mailing list).
    * Active Arietids Meteor Scatter users = 12 (seems pretty good for one
of the less popular MS events).
I hope folks find the database useful.

thanks, W9IF

=== original email message follows ===

BEACONet User Registration:

Ev and I have been working on a web page to allow us to take a "census" of
BEACONet users. If you would like to be counted, please take a moment to
complete the form, it takes about 1 minute. The link below will take you to
a registration page. It will give you the option of registering for the
Arietids Meteor Scatter event OR as a BEACONet participant. Complete the
form for each band you will be operating on. So if you are out there and
you actively participate in BEACONet, take a moment to be counted.

METEORegistry Registration:

About a half year ago I developed the METEORegistry web page to allow folks
to register as participating in MS events. The purpose of registering is to
provide a real-time list of participants to expedite communication and
increase the chances of success. There are 9 questions, it should take
about 1 minute to complete. The Arietids MS event is from May 22 to July 2
with a June 2 peak.

Click on the URL below and then click on Register Here link.

Hi Rich

I was so excited by what I though to be really cool catches I got your name
and call wrong. Your packet was fine.

Rich

Hi all, I noticed when I set WinAPRS to display direct stations only I
ended up with a log file that has lots of station calls with the *.

There was a huge 2 meter opening to Orlando from SE USA on May 27 -> 28 and
I have the log files and screen shots for both days at:
http://psk31relay.net/vhf_ss1.html

I will leave it there for a few weeks in case anybody wants to have a close
look at the log files. There might be something to learn in these logs,

perhaps there is some way to use APRS packets for watching propagation.

----------samples below----------

I logged more interesting APRS on May 28. my understanding on how to read
them is if they have a * in them the station to the left was the one it was
received from. This being true than I have some more long range packets to
help support the possibility that I was receiving some of the packets direct.

AB5WF>ID,KF4ZLK,KU4LY-7*,WIDE3-2:AB5WF/R 5WF-1/B
(received from ku4ly-7 350 miles)

KD4MOJ-5>BEACON,KF4ZLK*,WIDE:KD4MOJ-5 Quincy Florida APRS Digi -
kd4moj@kd4moj.org
(received from kf4zlk 465 miles)

W4AP-8>APRS,W4AP-7*,WIDE5-2:Montgomery AL W4AP MARC DIGI (kb4jhu@arrl.net)
(received from w4ap-7 397 miles)

Interesting anyway.

CUL, Dale kf4sir

Stand by...I'm working on a list of suggested BEACONet frequencies on
other HF bands. Just remember, anything lower than 28 MHz is at 300
baud...which will be significantly more difficult to tune-in.

A ten or eighteen MHz frequency sounds good to me! 300 baud
would probably be an advantage as long as we are on frequency.

Hi Ev
I did not know that Rich caught my beacon! Also Rich did not plot on the map
:-(I saw him in my terminal window and his beacon was passed to PKserver and
retransmitted on BEACOnet^31.

Just so I don,t screw up anything here is my setup HY1E-15 (personality was
set up wrong below) . 25 watts,Antron 99, 40 foot to bottom of antenna. Sorry
I do not know the HAAT for my antennas.

Also You might be interested in this BEACOnet contact I am not sure it was
two way. Joe is to far away for every day contact about 435 Km but sense I
cough 2 of his beacons close together I can't begin to guess what propagate
his signal. I have never heard him before or sense. If you find this contact
useful for the website I do have a screen shot ill send you.

Hi Ramon,

Have been on the air since 1200Z on 04 June 01 and not a thing to show for
it. Thunderstorms aren't "supposed" to be back until Tuesday night so will
leave things running until tomorrow evening. Hopefully, I'll see something
on the map tomorrow.

PLEASE, if anybody sees my beacon let me know. Sure would be nice to know
this thing is working (I looked and the antenna is still in the air and the
coax still connects to it!)

Bob - KC5DUI - EM26WE

As of 19:30 EDT, my station is again up and running on 10 and 2 meters.
Look for me on 21.131/+1500 BPSK

I got this note this morning, and thought I'd share it with the group.
The 2-meter system is building up across the country. Activate and stay
active. The summer tropo season keeps getting wiped out by all the
weather fronts, but it's just a matter of time until things stabalize a
bit and things start pop-ing. :o))

Rendered body type: text/plain

Hi all,

After 24 hours on BEACONet^31 (28.131) without a nibble have switched over
to BEACONet (28.128) for the next 24 (wx permitting). System seems to be
working normally - need to go check the propagation webs to see what's up.

Maybe today will be a BIG day.

Bob - KC5DUI - EM26WE

Hi Ev,

Switched to BEACONet at 1200Z and had you on the map starting about 1241Z.
Tried a Query with good success and sent you a couple lines. Am checking
the system from work so won't be able to constantly monitor it (try to check
every hour or so). Looks like today might be good!

Hey folks, just received this from SpaceWeather.com. The Arietids have not
yet peaked for this year...Keep it all going in Meteor Mode.

Space Weather News for June 5, 2001
http://www.spaceweather.com

The annual Arietid meteor shower peaks this week on Thursday, June 7th.
The Arietids are unusual because they are daytime meteors -- most of them
streak through the sky unnoticed while the bright Sun is overhead.
Nevertheless, early risers on Thursday could spot some beautiful
"Earthgrazing" Arietids during the dark hours before dawn. Later in the
day, after the Sun rises, you can listen to the shower by tuning in to
NASA's online meteor radar.

or better said.... NO report.

I was active all day long on 28.1325 but I have ZERO stations in the log

--Ramon [FN42KI] W1/PA3EUG Boston, MA

ps... finally got my APRS tracker boxed and ready to go. All I need to do is
pull the power to the trunk.
Config is:
* Delorme Tripmate (heavily modified) with AntennaFactor SE series external
ampl. antenna
* KPC3+ with software V7.0
* Icom handheld IC-W2A (I believe)
* Mirage B34 amplifier
* small cooling fan
* tupperware shoebox-sized box

It's running off my desk right now, for posit see
http://map.findu.com/pa3eug-9

I know it may sound like a very simple change that you have requested, but
it would take me about 4-5 hours (perhaps more) and then another hour or so
to test it. BEACONet is a database, making changes isn't not so easy, at
least not for me. As Ev suggested, put the information in the comment field.

thanks for the feedback and hope you find it useful in it's current state.

Rendered body type: text/plain

The Meteor Scatter Web Pages has 12 users registered. I just wanted to wish
every one good luck in the event. Hit a few rocks for me.

thanks, W9IF

METEORegistry Registration:

About a half year ago I developed the METEORegistry web page to allow folks
to register as participating in MS events. The purpose of registering is to
provide a real-time list of participants to expedite communication and
increase the chances of success. There are 9 questions, it should take
about 1 minute to complete. The Arietids MS event is from May 22 to July 2
with a June 2 peak.

Click on the URL below and then click on Register Here link.
http://w9if.net/cgi-bin/beaconet/main.pl

Hi Bob,
I got home late last night...and notice alot of 10-meter BEACONet
activity, too. I see the messaging activity. Very cool! Sorry I
missed you "live", though. :o)

Congrats on the APRS tracker, Ramon! I've been working hot and heavy with a couple of VHF Contest rovers in the Northeast who will be activating with BEACONet for the upcoming VHF contest. I'm still a day or so away from having a GPS-connected mobile BEACONet transmitter ready for each of them, but -- if all goes well -- they will be activated for the weekends, VHF Contest.

So...this is a "heads up" for BEACONeters in New England and the MidAtlantic states: you may be seeing a "puppy" on your screens this weekend. One Rover (what we call these types of stations on BEACONet) will have will have *both 53.530-MHz *and* 147.585-MHz active (as a bit of a test to see what the coverage will be on each band). Another will have only 53.530-MHz.

Here's hoping that I can get these folks lit-up in time for the weekend's event.

Hi Rich and all

Here we go again. I received 2 of your packets today. They were about 31
seconds apart. I think that you hit a cache of meteors or the worlds shortest
opening? What was your TX time? 31 seconds does not fit meteor mode.

What was that antenna again? I had to leave the house for a much longer time
then expected today and when I got home my 10 meter rig had no display. The
text below is from my log file.

Hi, Ev,

I was having a similar problem and got the
attached advice from Ken at Kantronics.

I do find that using the Pacterm (DOS) program
works well for me on the KPC3-Plus if I
use the routine "F9, F1, F9" after I am sure
that the serial port and baud rate are set
correctly (F7 and F8.)

Hope this helps.

Agreed, Bruce! Please register your 24/7 operation folks. This is very

important. I will be writing a follow-up/wrap-up article for QST. I'm
trying to figure out a way to document everyone who is active so I can
attempt to mention them somehow in the article.

There is no doubt in my mind that there are a lot more participants than
there are registrants (it's the nature of such surveys). Please...take
the time to register your non-meteor, 24/7 activity.

More cool stuff. In this case it does fit meteor mode. I set up UIView to beacon on 10m for a 2-second
 burst at 0 and 30 seconds past the minute in Meteor Mode this morning.

Looks like for about 1 minute today you caught a piece of two separate bursts.

Running HX-10 to a 40m inverted-V dipole at 40' with tuner.

OK Rich!

Looks like we got something going. I ran meteor mode on 10,6 and 2 meters
most of the day today burning the heck out solar energy on a cloudy day. Glad
someone heard me. Nothing heard here today :-(

Thunderstorms have "disappeared" from the forecasts so am back up on 28.128.
Currently running in meteor mode with about a seven second burst (wanted to
be able to "listen" for stations in the same quadrant). Hopefully, will be
able to stay active for the next couple of days.

Bob - KC5DUI - EM26WE

Hi Rich,

Started getting you on the map at 0118Z!! Lots of fluctuation (QSB) on the
signals but normally get at least one hit during each of your "bursts" -
probably wouldn't have anything if it wasn't for the meteor mode.

Are seeing me and/or anyone else??

Bob - KC5DUI - EM26WE

Wasn't a long period of activity - last plot was at 0122Z. I'm going to
continue running over night in meteor mode using a 7 second burst so I can
possibly see anyone else in the same quadrant. My timing should be pretty
good as the clock is reset every hour via the internet and last change was
+0.22 secs. Hope to see some more plots.

128. [propnet] 29 MHz AFSK (FM) packet?

From: Ramon Kolb <ramon.kolb@usa.net>
Date: 8 Jun 2001 09:28:01 EDT
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-17476-2001.06.08-08.47.33--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi folks,

I have a question. I am thinking about doing some experiments with BEACONet
using AFSK packetradio on 29 MHz (29.250??). Now I know this is not
"standardly" allowed here in the US. Here's what I'm wondering:

1) would it be allowed if I use a CW ID at the end? What's the exact legalese
involved with this?
2) if not, would it be possible to apply for a "special permit" with the FCC
for a well-defined, narrowly worded experiment?
3) can we pressure the FCC (maybe through the ARRL or TAPR) to get this
included in the bandplan/regulations so we can finally do what HAMs in the
rest of the world have been able to do for ages?

Please give me your ideas. Who's the bandplan-lawyer among us?
(Yeah, I know, before I can do question "2" I should probably get myself a US
license... but that would have to be an EXTRA class as not to lose my
reciprocal/CEPT privileges here).

Thanks,

Ramon W1/PA3EUG [FN42KI] Boston, MA

Ramon,
AFSK data is not allowed anywhere on the 10-meter band, in the USA. FCC
rules prohibit it. I've got a petition for rulemaking all penned up,
but I don't know how to submit it. When I do...I will. Unfortunately,
given the FCC's position on such things, I've put it on the back burner
for the time being.

As an aside, maybe I should post it out there (on the web) for "peer
review" before submitting it? I don't know.

Rendered body type: text/plain

Have you been waiting to catch the "big one"? Wait no more! You have
just a few days to power up and get ready: the band is about to open
coast-to-coast.

No kidding! late next week, it will be possible to see "VK" (the band,
not the country) icons from all over the USA, Canada and Mexico. What
will it take? A standard BEACONet station, on 2-meters, running no more
than 25 watts (and probably a lot less).

Get your station ready and power up. Use this week to practice (even if
there isn't anyone "on" in normal range). More information is
forthcoming.

Trust me on this one...if you've been fishing with not even a nibble,
then this activity is for you. Before you can see success, you must
activate. Please do so now (and re-activate if you've taken a
breather).

Intrigued? You should be! :o))

Ev, W2EV
PS...if you think you know what I have up my sleave, then bite your
lip...lets let the excitement build (no one will be disappointed).

Rendered body type: text/plain

Hi all,

The 8th was a bust as far as 28.128 for me - had a couple plots on WD4RBX last evening but nothing all day long. Between 0026-0047Z 9 June had several plots on LU3AVO plus LU3AVO digipeating LW2DCD and LU7DAC. My old 486 computer with the MFJ 1276 copied this while my SoundCard and Baycom showed nothing happening in the world. I keep thinking about simplifying things but then find that one will copy something that the others miss. Was thinking the MFJ was more "sensitive" but it never seems to copy W2EV while both the SoundCard and Baycom do a great job on Ev. Must be some combination of signal modulation and strength and ..... and ..... - maybe this is all MAGIC!!

Hi all. Back in 1987 I wrote a QST article on a High Dynamic
Range RTTY Terminal Unit. Following that I applied for a STA
which stands for Special Temporary Authorization for AFSK on
ten meters. This STA was to use both wide (850 Hertz and 170
Hertz shift). About all I can conclude is that the experiment
was a miserable failure, at least the path between W6 and VK3!
     The point for present day is that we HAVE what we need in
the PSK 31 approach on 28132.5 kHz but we need to solve the
frequency stability problem. In the last few days I have made
many measurements and found the problem is with the stability
of the sound card----not the RF transceiver! The COHERENT
group has been using slow speed BPSK for years which requires
stability of one hertz. VE2IQ has done the programming and
provided a kit in which the A to D function is done externally
to the computer. This avoids the sound card stability problem
and allows one to concentrate on RF stability. Nowdays even
this is not a problem as modern transceivers have one hertz
tuning steps. High stability internal master oscillators are
very inexpensive, even PSK31 with AFC simply does not need
this much help! A simple program such as DIGIPAN works
marvelously well but requires manual transmission to simulate
the beacon mode. In conclusion, all we have to do is improve
on what we already have. Use an external counter as a start
and improve the transceiver as it becomes necessary!

Hi Ev and the group. I am going back to 28128 kHz in a few
minutes. There simply has not been any signals on PSK 31 for
days out here in the West. There was a 1.5 magnitude flare
this morning, however. My system does not work at all well
on AX25 requiring a S3 signal minimum. A brand new half wave
vertical has been put up at 55 feet so if I might have a few
reception reports it would be appreciated. Cliff K7RR

Been on 28.128 and 2 meters since 6 PM EDT yesterday.

Copied no one on screen or in station log.

See only myself in the terminal window of UI-View32.

Welcome to the RF Dark Hole of Kentucky!

Joe, K4DMU

Your sure not alone Joe. I do wonder if we should try for a
300 baud frequency on either ten or eighteen MHz? Cliff K7RR

10 meters is very quiet here...throughout the band...with the exception
of N-S Transequatorial stuff. Don't dispair. :o)

Also...don't forget that the tradeoff for going 300 baud is the need to
assure high frequency stability. a 170hz shifted transmission must be
more exactly tuned...which will introduce a whole new set of problems.
Not to say that it would be bad to experiment...but let's not also
forget that we don't see icons because the band is not propagating. :o)

144. [propnet] TARP DCD MODS

From: RickfordG@aol.com
Date: Sat, 9 Jun 2001 18:07:56 EDT
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-17738-2001.06.09-17.27.38--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi All

There was someone in the group that was interested in the DCD mods. I was
wondering if they had tried it to see if it helped the BEACOnet cause?

I would like some help deciding if this mod would be useful for BEACOnet. If
you have a TNC that does not operate open squelch then it certainly would. My
MFJ does operate open squelch (RX-2211 chip) so what would be the benefit?

Thanks for your help!

Rich
WD4RBX

146. [propnet] AX.25 Sig/Noise and Propagation

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Sun, 10 Jun 2001 08:11:55 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-17806-2001.06.10-07.33.35--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Recently, I've received quite a few eMails from folks who were, in one
way or another, asking the question: "Why 1200 Baud AX.25 packet to plot
propagation when there are so many other modulating/demodulating methods
and entirely different systems (other than BEACONet) that could/do 'work
better'?".

Here are the issues that BEACONet (AX.25) addresses:
* Simplicity
* Reproducability
* Software Support
* First-person participation

Where AX.25 "isn't as efficient" at copying weaker signals than is, say,
CW...we attempt to make up for it by encouraging the use of higher power
output. On 6-meters, the average CW propagation beacon runs <10-watts
output. There is an estimated 6-10dB "advantage" between a "decoding
budget" of a CW signal being aurally decoded by someone with a 3-khz
wide receiver and an AX.25 packet signal being decoded by a TNC (round
estimates). By encouraging BEACONet operation to take place at "the
highest livable power output", we get close to normalization. In
effect, a BEACONet station running 40 to 100 watts output ought to be
decodable at approximately the same time as a CW beacon at 10 watts.

It is important to review the whole picture, though. CW beacons are
spread all over a 'beacon subband', adding further complexity to using
them to determine if/when the band is open. With BEACONet, we're all on
one frequency. If you use an omnidirectional antenna, you are covered
as to plotting openings from/to any direction, to any area of the world
(as long as there is a BEACONet participant there).

Additionally, BEACONet stations can "help each other" to be warned about
band openings that may be building in one area, while not present in
another. All it takes to to include HOP1-1 or HOP2-2 after your
configuration code. A fellow 50-miles away may be experiencing an
opening while you are not. By digipeating (once or twice), it is
possible to use the network to warn areas that are not presently
enjoying the opening that one is in progress nearby, and to keep your
eyes open. Try that with a CW beacon. :o)

There is nothing wrong with trying to maximize RX sensitivity, either.
This can be accomplished two easy ways: TNC "upgrade" and receiver
"upgrade". Use a Kantronics TNC to take advantage of "open squelch"
operation...it works *very* well. Play with hardware DCD modifications
(the jury is still out as to their effectiveness in high-noise HF
applications, but play and tell!). Here's one very effective and
overlooked station enhancement: antenna RX preamplifier! All sorts of
folks make them commercially:
http://www.advancedreceiver.com
http://www.hamtronics.com (I think they make 'em, anyway)

Food for thought. Experiment a little and share what you learn with the
rest of us. I've done my best to advertise that the BEACONet experiment
will run through the fall of 2001 (so folks didn't feel obligated to
stay active ad infinitum). Let's take advantage of the participation
that we have to learn new and cool things. It may keep newbies engaged
longer, and may add to the "state of the BEACONet art" so much so that
it reinvents it for yet another year!

The work that many of us have been doing on BEACONet^31 is a great
example of the dedication effort to advancing the art. Well done!

Sorry so windy... :o)

More to say, but I gotta get back to the VHF Contest. :o))

Rich, I've experimented with both squelched and open squelched RS 2211
chip demodulators with the DCD in and out. At least in the PK 232 with
the DCD TAPR kit installed the signal level required for the DCD to pass
information is very large. It works well with VHF FM signals but not at
all well on HF. The same result was observed in the MFJ 1274. Possibly
some engineering can be made to make the DCD work at a lower level.
     I've simply removed the DCD and operated with the threshold control
blinking on noise. Seems to work far better. Cliff K7RR

Ev, Joe and the group. No need to be fearful of frequency stability or
different TNC tone frequencies either on 300 or 1200 baud digital. The
rule in digital systems on HF has been: The lowest emitted RF frequency
is considered MARK and is the published channel frequency. So if you
choose 1700 Hertz as MARK, just move the dial 1700 Hertz. For 2125 Hertz,
move the dial that much also. Remember that the AMTOR/PACTOR folks have
been doing this on HF for years without ever hearing a signal with which
to tune to. That is how the unattended operation works. The message
receiving station scans the receiver over many channels and stops only
when a proper MARK is obtained. 300 baud operation allows the use of 500
hertz filters, a great advantage. 1200 baud operation on 28131 simply
needs to be improved just a slight bit to be highly successful especially
with PSK31 programs that have AFC capability.
     As for frequency stability, I mentioned earlier that the sound card
appears to be the major source of drift, the transceiver is not. This
comment applies to any computer in which the internal crystals (2) change
temperature. My laptop is especially bad finally settling down after half
an hour warm up. The desk top shows little or no drift. 73 Cliff K7RR

Howdy all,

I'm not sure what Ev is alluding to regarding VHF propagation later this
week, but it's already getting very good here in the heartland. At 9:00 PM
CDT I listened to a net sign on to 146.94 MHz FM in Omaha, NE. That's 156
miles north of Topeka, KS where I am. Then I heard conversations on three
other repeaters on the same frequency located in Wichita, KS at 127 miles
SW of me, Pittsburg, KS at 124 miles SE, and Kansas City, MO at 62 miles

E. There might have even been a fifth one in there too as the propagation
kept changing around. I think Ev may just be right about it going wild
this coming weekend. I'm waiting with anticipation to find out why. How
long will you keep us in suspense, Ev? <grin>

May your SWR always be low and your signal be strong!

Ok, I hate to be the new dumb kid on the block but I am. I finally got UI-View
installed and the station is running 24/7. I am running about 100 W (with pre-amp
on) on 147.585 MHz with the omni antenna about 100 HAAT - with about 6db gain. My
configuration code is: VK1GC4-15 is this right? I have been running for a couple of
day but have not heard anyone/anything. Am I doing something wrong or is there no
one near EM28qx?

I don't want to continue doing it wrong, if I am. Any advice (within reason ;-) is
welcome.

Thanks
Don

Hi Don

Welcome to BEACOnet! The only thing that you might want to do is change is
your antenna gain to element count. If you want to see if you are receiving
(set up) properly you can tune your rig to 144.390 APRS freq and if icons
start popping up on your screen you are all set. My guess is that there is
not a BEACOnet station close enough to you and that is why you haven't heard
anything. Not to worry! Tropo is building and if I am right about the opening
that Ev is talking about it truly will be spectacular.

Don't forget about the BEACOnet web site. It offers a wealth of BEACOnet
information. Ev has done a super job putting it together. I print out the
information for future reference. Also if you plan to activate 24/7/365 you
can go to the BEACOnet registration web site and register so others will know
you are active and who knows maybe a new comer will see you are close and
fire up the rig. The beat part about registering is that we know that you are
active. On a personal note. I am excited to have you aboard. You are in range
(at least I think so) should the band open. The 2 meter tropo that I have
worked over the years has been to FL, TX and your neck of the woods. The
longer you keep your BEACOnet cast the grater the chance you will catch fish.

I started my 24/7/365 2 meter beacon this weekend and need to register myself.

Almost forgot :-(you might consider setting up as a BEACOnet digi HOP1-1 or
HOP2-2 The purpose and set up is on the web site. If you have any problems
drop us some E-mail and someone will help.

Would I better serve the BEACONet community by running my KPC3+ beacon
on two or six meters during this opening? I only have one TNC, but both
rigs have the same output power and antenna gain.

158. [propnet] Possible UI-View addon

From: RickfordG@aol.com
Date: Mon, 11 Jun 2001 18:33:20 EDT
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-18081-2001.06.11-17.53.07--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi all

I dropped Andy Pritchard (G7OCW) the author Of UI-Path a line the other day
asking him if he could modify UI-Path so it would act more like a band
opening logging program. Here is what I wrote and his response is at the
bottom. First BEACOnet addon :-) Keep your fingers crossed.

Rich
WD4RBX

Hi Andy

Thank you for a wonderful add on to UI-View. I am one of the participants in the BEACOnet propagation experiment. I know that UI-View has the ability to run a log file that I can play back and see just what happened while I was out. This is all well and good for one beacon at 5 minuets intervals. I run 3 beacons and to look back at what happened is quite time consuming especially if I ran the 3 beacons in meteor mode.

Here is what I was wondering. Would it be to much of a pain in the butt (or possible) to have UI-Path do something like this? First heard time | last heard time| Reset after a certain amount of time so the same station can be logged again.

Example

I first heard KC5DUI at 4:00 AM I received 2 of his beacons Last heard KC5DUI at 4:15 AM. Then I first heard KC5DUI at 6:00 AM RXed 10 of his beacons. Last heard KC5DUI 6:50 AM What this would tell me is that during the first opening I missed one of his beacons (know his beacon time to be 5 minutes) in the middle and the opening was not so hot. In the second opening I received all of his beacons and it was a good opening. Extremely useful information. Suggestion: Maybe you can set up "First heard" as an ON | Off option and "reset time" as a minute / minuets type in box.

Thank you for your time.
Rich
WD4RBX

Hi Rich

An interesting facility which may warrant it's own add-on. I will have a think about it and see what I can come up with.

73 - Andy, G7OCW

Mark has good point. I can also switch to 2m (one TNC as well-
hopefully 2nd one will live again) on a vertical or 10 element beam (but
then what direction?) Level 1 only.

Hi All

What's left of tropical storm Allison has been pumping Thunder storms 40 or
50 miles to my south and east all day long. The WX service has been telling
us to expect Thunder storms and heavy rain starting tomorrow and continuing
on and off for the next few days. My wife Ruth will be helping me keep the
beacons on the air during the day but at night they will be shut down.

Bad for BEACOnet but good for our 4 year drought like conditions.

Good fishing

Take a look at Rich Parry's registration page to see if there is any
direction that is "better" than another if you are using a directional
antenna, Bruce. ((another good reason to be sure we've all registered
our BEACONet activity, if we haven't already))

http://go.to/METEORegistry (it's not just for meteors anymore) :o)

Hi Don

When you get to the BEACOnet website click on Configuration (top menu bar)
after it loads in click on level 2 in the side bar menu. Print out all the
instructions and give it a try. If you get stuck let us know what is giving
you trouble and we will be glad to help. It's really not as hard as it looks.
Take it one step at a time. Don't forget you can push F 1 and get help with
the window that you have open.

If you tuned to the APRS freq (144.390 FM) and saw icons popping on to your
screen then you are RX is fine. Since your friend heard your packets it
sounds like your TX is working.

Good fishing!
Rich

Rendered body type: text/plain

Folks, I'm not kidding about this. It's time to make sure that your
2-meter BEACONet station is powered up and functioning, if at all
possible.

You won't need high power...and actually will be asked to keep your
station to a power level of 25 watts or *less*. As usual, the best
antenna will be an omnidirectional.

Take the time to make sure that you are *not* overdriving your
microphone gain with TNC audio. We want to make sure that deviation is
around 3.5 KHz. Chances are, if your mic gain is at 12:00 or higher, it
is set too high.

I promise, this will be a memorable event...especially for those
BEACONet-ers who have kept the faith on 2-meters, but haven't seen much
positive success (I'll save yet another outright plea for the
establishment of Peer-Hubs for another eMail <smile>).

Last, it will be very important to assure that your packet length is as
short as possible. For this event, please remove your eMail address
from your transmission. You can put it back later. You will be asked
to post any reports directly to this listserve (so they can be
analyzed).

This is the last of the "vague" eMails about this event. The next time
I post, I will provide full disclosure on how this continent-wide
opportunity will occur (it's been fun anticipating it, though...hasn't
it?) :o)

```
Power up!
Ev, W2EV
W2EV>VK1E22-9,NOCALL:[FN03XD]     :o)) -- how's THAT for a hint?!
                                          more tomorrow!

Hi all,  looks interesting. I wonder if I can set my Kenwood TH-D7 HT to
send this format? Use the Beacon text (BT)?

Just might have to grab the Arrow hand held beam and go bird hunting (real
big bird)!

Let's see, W2 to VK - must be some type of store and forward or gate, not
simple digi.

Looks like fun and any tips on setting up the HT would be very helpful.

Thanks, Dale kf4sir

178. [propnet] The North American event is one day away

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Thu, 14 Jun 2001 07:11:56 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-18442-2001.06.14-06.33.35--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I hope you've taken the opportunity to power-up on 2-meter BEACONet,
because the "big event" is about to unfold...

First, I'm a bit suprized that we've not seen more success on bands
other than 10 and (a bit) on 6 meters. I'm hoping that our 2-meter
participants haven't gotten discouraged. With the hopes of letting
those folks experience the excitement of a "band opening", just to whet
their appetite for what is bound to come later in the summer and early
in the fall, I'm pleased to announce an event that is sure to please:
working "through" the International Space Station!

The ISS has a TNC aboard, all setup to digipeat your BEACONet
transmission! It's orbit is high enough so as to make coast-to-coast
catches possible. Along the way...by utilizing transmissions with
BEACONet configuration protocol embedded, we BEACONet-ers will be
engaging in a bit of research, in helping to determine a path budget to
allow reliable use of the ISS' on-board digipeater! <cool, huh?>

This is what you'll need to know...For a 12-hour period on FRIDAY
(tomorrow...comeon...I've warned you) -- from 6:00 am until 6:00 pm
(local time) setup your BEACONet station to operate as follows:

Maximum RF output of 25 watts, but less is fine, too -- really!
Setup your Configuration Code correctly (http://go.to/BEACONet |
Configuration | Configuration Code for a java-based calculator)
Remove your eMail address from your transmission.
Add the following after your configuration code: ",NOCALL" (without the
quotes) -- NOTE: This is important! Without this, the ISS will not
digipeat you.
Set your TX interval to 2-minutes.
Set your TX frequency to 145.990 MHz (this is not a typo)
Set your RX frequency to 145.800 MHz (this is not a typo)
Optionally: open a log to analyze the numbe of times a given station was
heard by you, as well as how often you may have heard your own station
being digipeated by the ISS. More on this later, by the way.

By the way..."NOCALL" is the "callsign" if the ISS. By placing
",NOCALL" after your configuration code, it is akin to placing ",HOP1-1"
there for terrestrial propagation studies...it is simply a request to be
digipeated. DO NOT USE HOPn-N while playing on the ISS frequency.

The ISS should begin "over flying" North America somewhere around noon
eastern time (I don't have the keps handy...if a keplarian BEACONet-er
can help with more specific times, then please do so).

Here are two links that can can help you to know where the ISS is at any

given time: http://spaceflight.nasa.gov/realdata/tracking/index.html and
http://www.heavens-above.com -- provided they have the most recent
keplarian elements loaded themselves.

BEACONet(ISS) is uniquely positioned to study the path and collision
budget of the ISS system, because of our standard use of a configuration
code. We can analyze results much more scientifically.

Welcome to BEACONet(ISS)! :o)))

Ev - here are MAX elevation times and directions for ISS from my QTH
[central Mississippi - EM42XI] of 32.3N and 90W. From WinOrbit with
latest (6/7/01) keps from AMSAT ('LCL Time' is local CDT - add 5 hr for
UTC)

LCL Date	LCL Day	LCL Time	Az	El	Range(mi)	Dopp	Lat	Long
06/14/2001	Thu	23:42:08	43	50	297	5	34.1 N	87.9 W
06/15/2001	Fri	01:17:42	235	9	901	60	24.7 N	101.0 W
06/15/2001	Fri	14:37:45	126	13	786	18	25.6 N	80.6 W
06/15/2001	Fri	16:13:27	320	38	376	6	35.2 N	93.2 W
06/15/2001	Fri	17:50:10	336	6	1068	-20	45.4 N	98.4 W
06/15/2001	Fri	19:27:49	357	0	1385	-28	51.4 N	91.6 W
06/15/2001	Fri	21:05:37	18	3	1196	-16	47.7 N	82.4 W
06/15/2001	Fri	22:42:38	37	21	568	-17	37.9 N	84.5 W
06/16/2001	Sat	00:18:33	230	24	512	56	28.0 N	95.6 W

BTW - I can usually hit the ISS digi off vertical at 400-600 miles or
right at 1,000 with beam
To see more info on ARISS, map of who 'hit' and current, projected 5 and
10 minute positions see

Hi Ramon, thanks for filling me in. Sorry about not reviewing the web site
before posting my dumb message (should have caught the 22 not valid call).

The setting up of my BeaconNet station has been on hold because I don't
have a fully supported TNC yet. As soon as I get my new TNC (Kantronics XL)
I will get things rolling and I'm sure it will all become much clearer how
everything works.

While I wait for the XL to come in I think I will try and set up the HT.
Looks like my code on 2 meters should be:
VK0C10-0

It's already happened! I was setting up to get things start for ISS tonight
and left it on, while we went out for a bit. Got 2 stations on the 0300
pass, one on either side of the country. N7OFW DN07ID, and WB4APR-3 FM19QD   .
So I basically had both coasts on the same pass although they were about 1
minute apart. We'll be on ISS freqs through tomorrow nite.

>Thanks,
>-Robert, KG6CFZ

Hi Robert and the group, don't forget about the Doppler shift. You will
want to be a bit high on the frequency when the space craft is coming at
you on RX and a bit low when going away.

 >Set your TX frequency to 145.990 MHz (this is not a typo)
 >Set your RX frequency to 145.800 MHz (this is not a typo)

Something like this when coming at you:
RX 145.810, 145.805, 145.800, 145.795, 145.790
TX 145.985, 145.990, 145.990, 145.990, 145.995 (not completely sure about
the TX shift, this might be off)

I hope this helps,

Dale kf4sir

186. [propnet] The band "opens" today! QSY Now!

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Fri, 15 Jun 2001 07:33:20 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-18618-2001.06.15-06.55.02--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Let's make this a huge BEACONet event. It's time to QSY to the
International Space Station's frequency, and let things run throughout
the day. I have just QSY'd myself and will let things run until
saturday

NASA has placed a TNC on the ISS as a global experiment with

UI-communications. NOTE: this is not a BEACONet or APRS specific
experiment. Users from all around the world are using it to have fun.
BEACONet is uniquely positioned to analyze the effectiveness of the
system because we are designed to operate 24/7 and embed useful
information into each transmission.

Below is a "reprint" of the instructions found in yesterdays message.
Here's hoping that we see alot of BEACONet participation!

Ev, W2EV

1.*Maximum* RF output of 25 watts, but less is fine, too -- really!
2.Setup your Configuration Code correctly (http://go.to/BEACONet |
  Configuration | Configuration Code for a java-based calculator)
3.Remove your eMail address from your transmission.
4.Add the following after your configuration code: ",NOCALL" (without
  the quotes) -- NOTE: This is important! Without this, the ISS
  will not digipeat you.
5.Set your TX interval to 2-minutes.
6.Set your TX frequency to 145.990 MHz (this is not a typo)
7.Set your RX frequency to 145.800 MHz (this is not a typo)
8.Optionally: open a log to analyze the number of times a given
  station was heard by you, as well as how often you may have heard
  your own station being digipeated by the ISS. More on this later,
  by the way.

By the way..."NOCALL" is the "callsign" if the ISS. By placing
",NOCALL" after your configuration code, it is akin to placing
",HOP1-1" there for terrestrial propagation studies...it is simply a
request to be digipeated. DO NOT USE HOPn-N while playing on the ISS
frequency.

The ISS should begin "over flying" North America somewhere around noon
eastern time (I don't have the keps handy...if a keplarian BEACONet-er
can help with more specific times, then please do so).

Here are two links that can can help you to know where the ISS is at
any given time:
http://spaceflight.nasa.gov/realdata/tracking/index.html and
http://www.heavens-above.com -- provided they have the most recent
keplarian elements loaded themselves.

BEACONet(ISS) is uniquely positioned to study the path and collision
budget of the ISS system, because of our standard use of a
configuration code. We can analyze results much more scientifically.

Rendered body type: text/plain

This is a reprint of a message from Bruce Brackin. Because the ISS is
capable of digipeating traffic coast-to-coast, and Bruce is in the
"middle" of the continent, I'd say that this is an excellent gauge of
best times to expect results (well done, Bruce!).

Don't forget that times are Central Time.

Ev,

Will this done again later in the Summer?

190. [propnet] Kenwood D-owners and the great "Opening"

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Fri, 15 Jun 2001 07:48:37 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>

Message-ID: <LYR1548-18622-2001.06.15-07.10.19--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

If you are an owner of a Kenwood D-series transceiver (the one's with
APRS built-in) you will need to use the fully ambiguous "CQ", rather
than your Configuration Code. It's unfortunate, but Kenwood's
implementation of UI-frame technology is very APRS specific, and doesn't
allow for the use of "Alt Nets" (as APRS calls 'em...and BEACONet uses
them).

So...participate as normal, but just use "CQ". :o(You'll still see
yourself get digipeated...a very good thing! :o)

Rendered body type: text/plain

Post your successful catches to the listserve! Don't forget to include
any Configuration Codes, too. I'll gather together all of the
information posted and print the synopsis over the weekend! California
to New England is well within the relm of possibility!

192. [propnet] Re: ISS (don't forget Doppler)

From: Ev Tupis <w2ev@rochester.rr.com>
Date: Fri, 15 Jun 2001 07:57:10 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-18626-2001.06.15-07.18.58--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

> Hi Robert and the group, don't forget about the Doppler shift.

Dale makes a good point for the extreme DX...but know that tuning to the
frequencies noted and leaving your station there will get you success.
Doppler is worst at the horizon. By the time the ISS is 30 degrees or
so above the horizon it is no longer an issue.

This is the first of probably several coordinated BEACONet(ISS) events.
It's ok to keep things simple for now.

Rendered body type: text/plain

You betcha! But don't wait until then, if you don't have to. :o)
Actually, the ISS is "always" active in this mode. We'll gather some
data from todays' coordinated event and run another coordinated event
again soon...however...I'd want to encourage folks to come back to
147.585 after this event...the summer tropo season is upon us. :o)

Who's on ISS today?

I QSY'd to 145.800/.990 but I'm running low power (5 Watts). (Further,
Beaconet^31 is running on 28.1325 as well)

Hope to catch you in my 2m log tonight!

Message-ID: <LYR1548-18694-2001.06.15-14.15.38--lyris.propnet#tapr.org@lists.tapr.org>

Rendered body type: text/plain

I can't believe it...but "I have sinned" (a line immortalized by Jimmy
Swaggert). Please...if it is not too late already...use ***LOW*** power
in your BEACONet(ISS) effort. 25-watts is like "shooting fish in a
barrel". Honestly...reduce to 5-watts -- OR LESS!

This is what I intended to communicate earlier, but failed to do so.
Dummy, Dummy, Dummy (hitting myself in the forehead)

Why low power? A number of reasons:

1. It's line-of-site, after all.
2. The frequency sub-band is shared with other satellite users, so
   low power = less likely to QRM other satellites
3. Because BEACONet can do it with less power. :o) The idea is to
   let BEACONetters who have yet to see any icons test their systems,
   but along the way, see if we can draw any determination as to
   power budget necessary to be heard, at least once, through an
   orbiting digipeater, then that is cool, too.

More on the neighbor thing in my next message...in the mean time...if
you can...drop that power level.

Also...don't forget...this is a one-day event. We will not be
continuing through the weekend (other issues are at play here). It's
back to 147.585 by no later than 9:00 pm local time tonight, please.

Ev, W2EV

Rendered body type: text/plain

According to AMSAT...the following satellites (among others) are in
operation:

UoSAT-14 Uplink @ 145.975
FO-20 Uplink @ 145.900 to 146.000 (!!)
ISS Uplink @ 145.990

Mine is not to wonder why the ISS frequency was chosen, but to share
this information so that we can be good neighbors. In the future, I
will get a satellite program and determine when these two birds won't
share the sky with the ISS, and we will play again. Until then, lets
simply make sure that we conclude our "band opening" tonight ... and get
back to 147.585.

We all learn together. :o)

Next pass comes in over Texas, and leaves over New England...this is the
BIG one...longest duration all nite..

Should be starting to the southwest about top of the hour,stations
southwest of me see it earlier than me...(approx 21:00 utc)

Good luck...

BEACONet active stations:
N4GIL

Others Heard:
W3ADO
N4IPV (without any GR##ID...so no plot)

Getting reado for Pass #2 in about an hour from now.

Ev, W2EV

Heard a couple of data squawks on the first pass, but didn't get any
copy with AGWPE/UI-Win. 2nd pass NA1SS was talking voice to a W9, and
then called QRZ.

One catch...N9LOT, and not a BEACONet-er. A raw packet w/o GR##ID so it
didn't plot, though it showed up in the terminal window. Next pass in
under 90 minutes. I've yet to see myself get digipeated, either.

212. [propnet] ISS so far today last 2 passes

From: RickfordG@aol.com
Date: Fri, 15 Jun 2001 18:19:21 EDT
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-18742-2001.06.15-17.39.16--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi All

I had to have some work done to my truck today and when I got home I found a
blank computer screen. My Diamond mono bander SUCKS canal water for satellite
work. Ounce I found that to be the case I switched to my SSB antenna and
tracked ISS manually on the last 2 passes. So for all intent & purposes my
beacon for the test is worthless.

On another note, I could not figure for the life of me why I did not RX any
New England states. Maybe the carrier that was mentioned could be the cause.

My BEACOnet cast! X = (number of beacons heard 2 passes)

N5VFF-1 X =1
K5NRK-2 X=1
N5UGI =2
KC4ZPL-14 X=1
K5PK X=1
W4EPI-1 X=1
N4GIL
N4IPV X=6
K5OE X=3
ISS _ 158 =2

WD4RBX
EM84NM

PS.
I would like to know if you heard my beacon!
TNX Rich

I re-pointed for the next pass, and Im sweating (Literally) the AC unit
into place presently.....drip..drip..I'll wait it out....gotta go to home
despot and get a plug..old one was 220v this one is 110v...grrr...

With response like this, Id suspect NASA wouldn't think there was any
reason to continue.

Received a packet with BeacoNet config code from one (as in 1) on passes
since wee hours (~0430). Unfortunently, it was my own. Lots of packets
copied from XE's land to VE's land but no other "VK"s codes.

Bruce, KD5IUG

I'm on, but don't have my config code in. We'll see if we can get that done
here soon. During the 2100 pass heard:
N5UGI
K5NRK-2
W8KZM
K5WPN
N5VFF-1 DM79MM   (Only posit recieved)

During the 2245 pass heard:
WS5R   DM95BE   (Me)
N5VFF-1 DM79MM
WB6OLA CM99GK
KD6PLI CM87XX
KQ6EA
WB6FZH
WA6LIE
W6EKK   DM03UV
WA6NAO
N9LLR
N0XT

Well, at least I heard my self. Running 25 wts into comet GP-6 at 20'

73,

Rendered body type: text/plain

Well, THAT was interesting.

I was connected for three passes, ending just a little while ago at 1730
PDT. I heard lots of packet via ISS, and dozens of stations.

Number of stations with APRS-style lat-lin data: 5

Number of stations with grid square info in their packets: two: WB6OLA and
W6EKK. UI-view decoded these even though they didn't have brackets around
the grid info.

Number of stations with Beaconet data: zero.

Biggest disappointment: Although ISS was quite loud and went nearly
overhead on one pass, it never digipeated my signal.

Ev: please give one more day's notice next time. Those of us who get this
list only in digest mode once daily didn't get much notice to prepare for this.

Dave,
Point well taken. In my attempt to get people excited, I lost sight of
several things...this included.

I need to ask Roger (UIView's author) to include a Scheduler, if
possible. That way, we could enter the times when we know the ISS is
overhead, operate, and then auto shut-down when the pass is
over...waiting until the next one.

Keep the faith...three more usable passes before it's all over :o))

Ev, W2EV

Hi All

Guess that you all are sick of my postings today. I was looking at UI-Path a
bit ago and realized that I heard a station in Florida "Direct" N4IPV not
ounce but 6 times. I was using my long boom Yagi. Tropo is alive and well
here in the South east. I am going back to 147.585 and do some fishing ;-).

There already is one.  File|Schedule Editor.  Don't "Exit" the Schedule
Editor window, just minimize it.  It'll Restart and Exit UI-View on
schedule like a trooper.

Rendered body type: text/plain

I have been trying to get UI-View and AGWpe setup on my system but have
been unable
to make it work.
AGWpe is running fine and I even heard some packets off ISS using
AGWterm.
But when I start UI-View I get an error box that says:

AGW TCP/IP error "WSAEAFNOSUPPORT: AF Not supported?"

I am running Windows 98.
Anybody have an idea what the problem is?

Thanks
Kevin...

Just run APRStk (A version of APRSdos) and it plots all of the amateur
satelites on the APRS map and it auto tunes your radio (If it is a kenwood
D7 or D700) and it rotates your Radio Shack $64 rotator if you have one
and it starts tramnsmittign when ISS (or any other satelite you have
marked for auto-tracking) comes into view, and resets its timers... And
stops transmitting when ISS goes out of view...

And it runs on an old 386 or so laptop...

Better for me this time. The ISS did hear and repeat me once, about 3
minutes after rise.

Quite a few more stations were heard, including several with grid squares.

Number of stations with Beaconet data: still zero.

Rendered body type: text/plain

Hope others had better luck than me. Received dozens of stations on the
passes in my area but only myself as far as seeing BeacoNet config
code. As more and more hams learn about the www.ariss.net page they
will be imbedding their grid square in their packet.

What Ev needs is results that have the 2m VKxxx-x code to id the station
as a BeacoNet participant.

One thing affecting results is we are talking FM here and capture
effect. When passes are during "Prime Time" there are lots of signals
headed for ISS - many from El/Az beams so it should not surprise us if
low power on vertical gets crowded out. Try the digi during the week
when some passes are in the late night / early morning - little traffic
then.

Interesting! N4IPV could have been heard direct only if he were
transmitting on the ISS downlink frequency. I wonder how many other
first time BEACONet(ISS) stations did that by mistake. :o)

Share some detail of the contact such as printing the frames that you
received and UI-View's Snapshot. This may be a BEACONet non-digipeated
DX record. :o))

Hi Joe,
Such pass groupings occur every day...but the pass times "drift" over
time. We are now coming out of a period of time when the ISS was
available only during the overnight and into a time when it will be
available over North America during the late afternoon -- through the
evening.

Quite an event, no? :o) It gives people a real taste for what we could
experience on the 2-meter BEACONet frequency with the establishment of a
good HUB network. After all, ISS is just a Hub-in-space. :o)

'Back to 147.585 for the time being. More data analysis of yesterday's
event will follow shortly.

You're right, Rex. I meant to say that it would be nice to add the
ability to schedule events that are further ahead than a single day.
There are those that have problems with TVI, but would like to
participate in the propagation research portion of BEACONet. Being able
to schedule on-going operation (beyond a single day) during "non-prime
TV time" would be useful.

By the way...the next time we give the ISS a try in a coordinated
effort, we'll do so with a couple of weeks notice, and will also include
directions to use UI-View's scheduler so we will be absolutly assured
that we don't inadvertantly leave our stations transmitting when the ISS
is below the horizon.

Hi Bob! And welcome to the list! :o)
Of course, folks, this is why APRSdos (and it's variants) is the only
other software system that I can recommend for use in BEACONet
activities. It will decode/display BEACONet packets (as long as you
remember to turn filters-off) and is not capable of corrupting the data
stream to the BEACONet LIVExchange Internet service (I'm building the
computer it will be running on right now) -- primarily because APRSdos
doesn't connect to the Internet ;-).

Here's a suggestion from Roger -- one that I will spend some time this
morning exploring. I would welcome comments from others, too, if anyone
else is inclined to play a bit with it.

Ev, W2EV

There is a scheduler - File, Schedule Editor. It only supports time
during a 24 hour period, i.e. you can't input a date, but it's quite
adequate for most purposes. Also, Win95 and later has the Task
Scheduler, which can be used to start UI-View at predetermined
times/dates.

245. [propnet] Best DX - BEACONet(ISS) June 15, 2001

From: "E. Tupis W2EV" <w2ev@rochester.rr.com>
Date: Sat, 16 Jun 2001 09:20:03 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-18832-2001.06.16-08.41.08--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

23:38:06R N7OFW>VK1EC2-15,NOCALL* <UI R Len=29>:
=4709.25N/11919.11W_[DN07ID]

This is 3,238.4 kilometers from my QTH!

According to the Configuration Code, Dave was running the following:
E=16 to 32 watts output
C=Antenna with 6dB gain
2=Antenna was between 20 and 40 feet high
-15=Omnidirectional pattern

I've not examined my log yet, so I don't know if this was a single or
multiple catch, but I find it to be interesting none-the-less.

Also interesting is the marked increase in activity on the later
pass...as one would expect since more non-BEACONet participants would be
arriving home and firing-up. Here's my UI-View snapshot:

2001-June-16 09:14 18 stations

By the way...I used a receive preamp. I would highly suggest that
others who are serious about this stuff do the same. I attribute a
large portion of my receive success to doing so.

fyi.

Do we have another scheduled day to "beat our heads against the wall" ? heh
After that first 4 station I heard in the afternoon, not another station
heard, (and I heard plenty packets) just nothing decoded or displayed. I
know the equipment works, I kept popping over to .39 and poof, Canucks
a-plenty...

At 09:35 6/16/01 -0400, you wrote:

248. [propnet] Matching TNC input impedance helps getting low level packets to decode

From: "John Atkins" <john.atkins@110.net>
Date: Sat, 16 Jun 2001 11:13:10
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-18846-2001.06.16-11.32.58--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

This is of interest to people using KAM+ TNC's and may also apply to other
TNCs.

I have a KAM + TNC and have found it to work well on all Beaconet
activities. It seems to be quite sensitive particularly with CD=SOFTWARE
set, but it's taken a bit of investigation and tweaking to get it working
really well in my set up.

I thought I would share my learnings, in the hopes that they might help
someone else.

My tranceiver is an FT-847 and I use the fixed audio out from the VHF port
for VHF work and the fixed audio out from the HF port for the 28.128/28.131
activity.

When I first connected up my KAM it worked very well on strong signals such
as local packet or APRS, but I always suspected that it was not very
sensitive to lower level signals. I could often hear packets, but they
never decoded.

Investigation with a scope showed that the difference between the open
circuit audio signal voltage from the radio and the audio signal voltage
when the KAM was connected was huge. In other words the KAM's input
inpedance was "clobbering" the audio output from the radio.

The input impedance of the KAM is fairly low. There is a 680 ohm resistor
across both the HF and VHF inputs to the KAM. This was too low for my
transceiver fixed audio output, which has a source impedance of about 10K.
I replaced the 680 ohm resistors in my KAM with 10K resistors, and it
seems to work well now and is very sensitive.

Monitoring with a scope shows that now when the KAM is connected, the audio
output from the radio is only minimally affected. My guess is that the KAM
was originally designed to work from the speaker or headphone outputs of a
typical radio, which usually are designed to drive a low impedance - hence
the 680 ohm nominal value.
If you make this mod, be careful of RF getting into the KAM. It's more
susceptible because the input impedance is now higher. I needed a few
ferrite beads on the input lines!

So if you usually connect to the speaker or headphone outputs, everything
is probably OK, but if you have one of the more recent radio's with a fixed
audio output,look at the specs to make sure it will drive the TNC's input
impedance (680 ohm in the case of the KAM+ Don't know what it is for other
TNC's, but it's probably similar for the same reasons.)

If you don't want to modify the TNC (assuming it needs it) there are other
options - run from the speaker/phones output with the audio level turned up
or use an emitter follower circuit to get a better match between the radio
and the TNC input impedances.

The problem is that there is no way of telling if the KAM is getting enough
audio, unless you can hook up a scope and see that the voltage level going
in is in the right range. (This applies however it is connected)

Summary: If you think your TNC is insensitive to lower level signals, but
it works OK on local APRS or Packet, check the drive / impedance levels.

For a weak signal application like Beaconet, making sure that the match
between radio and TNC is optimized makes the diffence between just hearing
packets and actually decoding them.

Hope this helps.

Hi all. Ten meters has been open since dawn this morning. Even six
meters has had a few openings. I've been on AX25, 28128 since 1600 UTC.
WD4RBX-EM84nm has been pounding in. Another strange packet:
[UA] A6 43 90 C4 EC xx xx xx xx etc.
also has been pounding in. Anyone know about this?
   I am on one minute transmissions. If that gets irritating, let me know.

Hi Cliff,

I've been on 28.128 since about 1400Z today but all is quiet in NW Arkansas.
Just came in from the yard so will sit with the headset for a bit and see if
I can hear any packet even though nothing has been plotting. Maybe the
propagation will move to the west so I can copy you.

Bob - KC5DUI - EM26WE

Hi Jerry,

I was using the satellite version of Moe, AE4JY's WinPSK which has a more
aggressive AFC loop. Once tuned, it would lock and receive OK. I did have to
reset each time when I went back to receive. The other operator, Henry, KT1J
was running Digipan and had to tune while receiving. KT1J and I had no direct
path so we used Mt Mansfield here in Vermont as a passive reflector. That
injected its own set of variables as well. The contact was only 65 mi, but
basically was to see if we could do it.

73,
Mike, N1JEZ

Ev,

Really don't mean to be a S.A. - but if you'req going to continue doing
sat work, this will come in REAL helpful!

http://www.satscape.co.uk/

I'm running your lat/longs now (gotta install satscape myself first <g>)

Hi Tate,
Thanks for the link. I've downloaded it. Now...I've got to learn how
to keep the keps up to date on it. Thanks!
Ev

Hi All. I've looked at satscape and it really is a good
program but far too complicated (4.4MB!) for International
Space Station use. Either the NASA site or PREDICT in an old
DOS machine that can be ignored would be fine. Cliff K7RR

Hi Ev

Ill see what I can do. Another good idea is to see if anyone has heard N4IVP
via NOCALL. The Snap shot will be easy (alt print screen on the 3 passes I
played with) but the frame is history. Ill send you my Phone # off list and
you can call me collect when something this vital happens.

Rendered body type: text/plain

>From Western NY, I snagged the following stations on the last ISS pass:

Icon
Decoded
in UIView Call - comments
--------- --
 Yes   KD2BD - Used Grid-in-to format...but UI-View displayed it OK
 Yes   VE3UO-7 - 5-watts, Arrow antenna. Put Grid in Digi.
 No   K2ISS - Name in To-field, no location information
 Yes   N8IGJ - Grid-in-To format. (Hi back at 'ya) :o)
 Yes   WB7SWW - Grid in comment, but not in [ ] - NOTE-1 below
 No   K7MT-11 - Name in To-field, no location info, other than MT
 No   W9ORW - Name in To-field, no location info
--------- --

Note-1: We use [GR##ID] in defference to the possibility that some of us
are APRSdos or WinAPRS users. Without the brackets they won't decode
the transmission. I am currently evaluating an alternate GR##ID format
that would allow us to imbed band information as a display icon...more
on this in the weeks to come.

Anyway...I'm amazed that there are as many variations of format as there
are stations attempting to use the ISS. Maybe with some planning, we
can "show 'em how we do it on BEACONet". :o) In a nice way, of course.

263. [propnet] BEACONet(ISS) Catch

From: "E. Tupis W2EV" <w2ev@rochester.rr.com>
Date: Sat, 16 Jun 2001 21:24:41 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-18916-2001.06.16-20.44.32--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Ok...some of us are still playing on the ISS. :o) Let's just remember
to make sure that we don't operate 24/7 because there are other

satellites using the same frequency subband and we will cause QRM.

Use the UI-view scheduler to make sure that we transmit only when the
ISS is in range, please...it's the "good neighbor" thing. :o)

Anyway...here are a couple of snags from the last orbit (just concluded)
of note:

21:02:33R N7OFW>APRS,NOCALL* <UI R Len=9>:
[DN07id]

Not a BEACONet-er (no config code...so who knows how much power or type
of antenna they are using), but the distance from my QTH is 3,231 km.
Not bad.

But the catch of note is:
21:05:21R W0IBM>VK0E22-15,NOCALL* <UI C Len=8>:
[EN34RB]

At 1,176km running:
E= 16 to 32 watts
2= 4-7 element antenna
2= 20-40 feet high
-15= omnidirectional (hmmmmm. a colinear maybe?) :o)

A great example of useful analytical information for budgeting ISS
traffic for sure.

Rendered body type: text/plain

Ah,

Yea - as nice as this program is, it's not your 'typical' Windows user
interface type deal, that's for sure. Does take a bit of getting used
to. However I find that once I've done something a couple times, it's
pretty easy to figure out more.

To update the keps, first - be sure your system is connected to the
I-net, then in Satscape:

hit F2 (or File -> Control Panel) *
click the Groups and Keplerian elements tab
click on "update keplerian elements and synch clock"
click OK on the modal box
click "Save and Close"

Keps are updated and your PC's clock is synched

Now, for a 'pass table', CTRL+F2 or click on "Textual Data"
Pass Predictins
click on ISS (1 month) under the list of jobs
click 'run selected job'
from there you can print results or save them to a file.

enjoy!
73
*this is also where you setup your 'local' information

Yea, that's the nice thing about Satscape. It's simple enough to use for
tracking ISS and flexible enough you can use it for more 'challenging'
uses.

4.4Mb for a graphic interfaced, flexible, sat tracking and pass mapping
package really ain't all that bad - consider the OS it's running on...

If my goal was minimalist 'Iron' to track with - I'd use somehting like
PocketSat on a Palm - not too shabby and a lot more 'field portable'
than any DOS machine I've seen, yet.

There's a reason most folks "ignore" "old DOS machine"s <g>.

For a DOS machine with an FPU, I'd suggest STSPlus - good output,
prooven use and has readable maps, even on monochrome VGA. Runs nicely
on my old 286 laptop. And I don't have to worry about loosing it's
stylus - again...

Don't forget about your antenna. I use an M2 eggbeater and get great
results. A QFH would probably be best, but we'll have to wait until after
the move to try it out. That 5/8 wave has a nice big hole in the overhead
pattern.

Wow...cool! Kevin, if you are using UI-View, would you mind taking a
"snapshot" (the button at the bottom of the stations-window) and
forwarding it to the list? I'd be interested in time and activity
information that the window would have in it.

Given the ISS' altitude at the time...this would probably be at the
extreme edge of its' footprint. Also interesting to note: I don't
doppler correct my TX (on purpose, by the way). Did you doppler correct
your RX?

Try an early evening pass on the UPLINK only! There are alot of folks
trying to uplink to the ISS, now that it is flying overhead in the
evening time in N.A.

How about spending some time listening to other simplex signals and
seeing if you catch a band opening in the process? There is already a
report of one such event being caught by mistake.

I'm going to try it myself tonight. Set your Beacon Interval to 0 (RX
only) and park your receiver on 145.990 MHz. Check out
http://www.ariss.net to see who has been reported as being heard
recently, and see if you can hear them on the uplink frequency!

Ev, W2EV
Give it some thought.

280. [propnet] BEACONet^31 off line this afternoon/evening

From: Ramon Kolb <ramon.kolb@usa.net>
Date: 17 Jun 2001 20:07:51 EDT
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-19044-2001.06.17-19.27.46--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi folks,

my 10 mts BEACONet^31 station as been off the air since the beginning of the
afternoon-- heavy thunderstorms in the Boston area. I will put the station
back on when I get home lateron tonight.

It seems that the conditions are pretty GOOD but I keep on having zero hits in
BEACONet^31. Again, (B)PSK31 is a low-power, stability-UNcritical mode (as the
receiving software will just tune you in automatically, even if you're off
frequency), but if nobody is there, I am wondering if it still makes sense to
continue my station in BEACONet^31.

I tried to participate in the ISS event, but my MFJ1276 is so deaf that it
wouldn't hear a cow mooing in its antenna :-). I just upgraded my APRS mobile
station to use a TinyTrak, which frees up my KPC3+. This should get me back on
2 meters. All I'm missing is a small PA that will boost my 5 Watts signal to
as-far-as-the-buck-goes. Right now I'm shooting for a 35 Watt more or less--
ebay shows several amplifiers at a good price.
Of course, if anyone has something lying around that he want to get rid of,
I'll be happy to entertain the thought...

282. [propnet] UI-View/Kantronics 9612 Plus Help

From: "Mike Jacobs" <mwj116@psu.edu>
Date: Sun, 17 Jun 2001 21:41:39 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-19048-2001.06.17-21.01.17--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

While I am usually pretty good with figuring things out from the
instructions, I find that I cannot get UI-View to talk to my 9612
(which has the firmware upgrade chip) using the KISS - Kantronics
Host Mode protocol. I did get it to work once using the No Host
Mode option, but cannot get it to work that way again (I returned to
the settings that I thought I used to get it to work, but no
joy...likewise for all the other combinations I have tried).

Rig being used is an FT-847.

Also, I have a local packet bbs on 147.57, which I can hear coming
through on 585 somewhat.'

If anyone has any specific experience with UI-View and the 9612
Plus, please let me know, thanks.

283. [propnet] A word (or a few) about STK!

From: blitz <blitz@macronet.net>
Date: Mon, 18 Jun 2001 03:06:18 -0400
To: "TAPR APRS PropNet Discussion Group" <propnet@lists.tapr.org>
Message-ID: <LYR1548-19068-2001.06.18-02.26.26--lyris.propnet#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Agreed! Agreed! agreed! Earl...

Well, not only are they extremely prompt in sending it, the included
tutorials are, to be blunt, AWESOME! Anyone who has the expertise we have
on aprs can be setting up a functional scenario in a half hour, hour at the
most. (Seriously)
This ain't kid stuff, its a full-blown military-grade satellite
manipulation program. I won't make any bones about it. You gotta experience
it to learn it, and then you step back and go WOW!
But OH! the features, I just love the auto-tracking of the ground station
against the bird...the little conical radius of signal acquisition is worth
the trouble to learn it. It gives an instantaneous direction of point for
your rotor. The auto-update of the keps is worth the trouble to learn it,
track multiple birds, it does it with ease. The latest release has
defiantly improved the maps as well, the AGI1024 earth-map is,
well, beautiful...
I'm the least easy person to please, but this program is worth the time
spent to learn it. Its FREE as well, for the functions we use, bird
tracking and signal acquisition..NO $$ just email to register in 5 mins.

Sorry if this sounds like a corporate rant, it's not...I'm the last person
to promote some company I don't get $$ from or own stock in (grin).
But for anyone wanting TOP SHELF sat tracking, mind you, you're going to
spend a hour in the tutorials, don't plan on less...it's the nutz!! The
tutorial files are complete, comprehensive, and very very good! Once you
see the features, it IS breathtaking.

Bob B. is prob sitting there grinning about this rant, I know all the major
players in space launch and NASA as well have this program...it ain't for
the timid, get sat-track if that's the way you wanna go, but this program
is well worth the trouble to learn. You can't download it, you got to
request a CD-ROM, but believe me, they're really prompt, (had mine in under
5 days) and its well worth a good look.
As they say..."it IS rocket science"...hehe

Try communicating with the TNC with HyperTerminal as a first attempt.
Is it possible that the TNC to computer cable has failed?

If you've changed any of the parameters, then I would highly suggest the
old Johnny Cochrane method of, "If it does not compute, you must
reboot". That is so say...perform a hard-reset of the TNC and follow
the "Level II" instructions on the web site (http://go.to/BEACONet |
Configuration | Level II).

Alternatively, share specific error messages with us and lets see what
we can do to help.

I'm sorry to hear of the PBBS on 147.57. Interestingly, there is also a
BBS in the W.Va./W.Pa. area on 147.585, too...it pops up on my screen
from time-to-time when the band enhances. Oh well, such are the things
we deal with. :o)

Rendered body type: text/plain

Sorry, I should have elaborated. I can talk to the TNC just fine with
Hyperterminal, and I had stumbled upon a UI-View setting that
worked by experiment, but I can't seem to find it again! Very
frustrating. I will try the hard reset on the TNC. The symptoms of
the problem are as follows:

If I set the comm setup to a totally wrong setting, UI-View pops up
an error window (as one would expect) and the terminal window
shows lots of junk.

If I set the comm setup to KISS and Kantronics, it seems to
communicate fine, but it never transmits. I have the transmit
interval set correctly. It doesn't transmit when I select the action
items to send a beacon signal. Also, in the terminal window, the
TNC is regularly showing these messages:

09:40:47R -7>@-12 <I S0 R0 Len=70>:
[PID 78]

The one time that I got it to work, these messages did not appear
and it would transmit on demand and at the proper interval.

Subject: [propnet] BEACONet(ISS) Catch

Ok...some of us are still playing on the ISS. :o) Let's just remember
to make sure that we don't operate 24/7 because there are other
satellites using the same frequency subband and we will cause QRM.

Use the UI-view scheduler to make sure that we transmit only when the
ISS is in range, please...it's the "good neighbor" thing. :o)

Anyway...here are a couple of snags from the last orbit (just concluded)
of note:

21:02:33R N7OFW>APRS,NOCALL* <UI R Len=9>:
[DN07id]

Not a BEACONet-er (no config code...so who knows how much power or type
of antenna they are using), but the distance from my QTH is 3,231 km.
Not bad.

But the catch of note is:

21:05:21R W0IBM>VK0E22-15,NOCALL* <UI C Len=8>:
[EN34RB]

At 1,176km running:
E= 16 to 32 watts
2= 4-7 element antenna
2= 20-40 feet high
-15= omnidirectional (hmmmmm. a colinear maybe?) :o)

A great example of useful analytical information for budgeting ISS
traffic for sure.

Ev, W2EV

Ah!

Found it http://www.stk.com

Thanks!
73

I just wanted to second what Earl and 'Blitz' (does he/she have a name?)
had to say about Satellite Toolkit (STK). I had to use it for my
satellite comm class at NMSU a few years ago. It is an incredible
package, and I would highly recommend it's use by someone really wanting
to learn about orbital mechanics and prediction.

73,
Tim, AA5DF

No problemo, www.stk.com
Youve got to order the FREE CD Rom online, its too big to d/l. They are
extremely prompt, I got mine in less than 5 days. Its online free
registration, so your ready to rock and roll in 5 minutes.

Ok, the downside, (if it can be called that) be prepared to spend a hour on
the tutorial. Please, finish the first one minimum. You won't be
disappointed that way. Most all of what you need to track our ham birds can
be gleaned from doing the tutorial. Also, refresh your keps, before
plotting your favorite ham satellite. Its free, fast, and online. Again,
you need to do the drills in the first section minimum to see all the hooks
and whistles.
